Chapter 1

Class Overview

1.1 Class overview

The most important user level classes:

HxImageRep (p. 620), **HxImageFactory** (p. 605), **HxImageSeq** (p. 646), **HxHistogram** (p. 548), **HxNJet** (p. 1063), **HxBSplineCurve** (p. 477), **HxSampledBSplineCurve** (p. 1129)

Basic classes and types:

HxScalarInt (p. 1164), **HxScalarDouble** (p. 1145), **HxVec2Int** (p. 1281), **HxVec2Double** (p. 1262), **HxVec3Int** (p. 1321), and **HxVec3Double** (p. 1301).

HxPoint (p. 325), **HxPointInt** (p. 325), **HxPointZ** (p. 1077), **HxPointList.h**

HxString (p. 358), **HxStringList.h**

HxMatrix (p. 979), **HxVector** (p. 1342)

Image related classes:

HxImageSignature (p. 685), **HxGeoIntType** (p. 231), **HxSizes** (p. 352), **HxTagList** (p. 1196), **HxValue** (p. 1253), **HxValueList.h**, **HxValueType** (p. 381)

Chapter 2

Pixels

2.1 Pixels

Since pixels are the atomic elements in image processing we start with the little ones. Actually, this chapter is not really about pixels, but deals with the representation and manipulation of pixel values in Horus.

This chapter:

- **Pixel value representation** (p. 3)
- **Arithmetic data types** (p. 3)
- **Unary operations on pixel values** (p. 4)
- **Binary operations on pixel values** (p. 5)
- **Color operations on pixel values** (p. 6)

2.2 Pixel value representation

Horus supports the following set of pixel value representations :

- **scalar values**: **HxByte** (p. 93) (unsigned char), short, int, float, double
- **complex values**: **HxComplex** (p. 506)
- **vector of 2 scalars**: **HxVec2Byte** (p. 381), **HxVec2Short** (p. 382), **HxVec2Int** (p. 1281), **HxVec2Float** (p. 382), **HxVec2Double** (p. 1262).
- **vector of 3 scalars**: **HxVec3Byte** (p. 383), **HxVec3Short** (p. 384), **HxVec3Int** (p. 1321), **HxVec3Float** (p. 383), **HxVec3Double** (p. 1301).

The classes and native types for pixel representations have a common set of operations that is geared towards storage and retrieval of the pixel values from memory. However, you will seldom use the pixel representations directly as image processing algorithms in Horus are written as C++ template functors based on so-called arithmetic data types.

2.3 Arithmetic data types

The set of arithmetic data types is defined to handle all arithmetic manipulation of (pixel) values. The set of arithmetic data types is smaller than the set of pixel representations to avoid an explosion of instantiations

in the template code. The arithmetic data types do not reduce computational performance in that most current processors are not able to do arithmetic operations on the original pixel values anyway, e.g. they can not add or multiply bytes, shorts, and floats. And, even if the processor could do it, the compiler would probably not support it.

The current set of arithmetic data types includes seven elements:

HxScalarInt (p. 1164), **HxScalarDouble** (p. 1145), **HxComplex** (p. 506), **HxVec2Int** (p. 1281), **HxVec2Double** (p. 1262), **HxVec3Int** (p. 1321), and **HxVec3Double** (p. 1301).

Each element can be constructed in one of the following ways: (i) without parameters (value is undefined), (ii) from another value of the same type, or (iii) from a specific number of corresponding native data types (**HxScalarInt** (p. 1164): 1 int, **HxScalarDouble** (p. 1145): 1 double, **HxComplex** (p. 506): 2 double's, **HxVec2Int** (p. 1281): 2 int's, **HxVec2Double** (p. 1262): 2 double's, **HxVec3Int** (p. 1321): 3 int's, **HxVec3Double** (p. 1301): 3 double's). A data type can also be casted to each of the other six data types as shown in the table. No other construction/conversion paths will be defined to avoid ambiguities in expressions.

	ScalarInt i	ScalarDouble d	Complex $\begin{pmatrix} d_1 \\ d_2 \end{pmatrix}$	Vec2Int $\begin{pmatrix} i_1 \\ i_2 \end{pmatrix}$	Vec2Double $\begin{pmatrix} d_1 \\ d_2 \end{pmatrix}$	Vec3Int $\begin{pmatrix} i_1 \\ i_2 \\ i_3 \end{pmatrix}$	Vec3Double $\begin{pmatrix} d_1 \\ d_2 \\ d_3 \end{pmatrix}$
ScalarInt i		$d(i)$	$\begin{pmatrix} d(i) \\ 0 \end{pmatrix}$	$\begin{pmatrix} i \\ i \end{pmatrix}$	$\begin{pmatrix} d(i) \\ d(i) \end{pmatrix}$	$\begin{pmatrix} i \\ i \\ i \end{pmatrix}$	$\begin{pmatrix} d(i) \\ d(i) \\ d(i) \end{pmatrix}$
ScalarDouble d	$i(d)$		$\begin{pmatrix} d \\ 0 \end{pmatrix}$	$\begin{pmatrix} i(d) \\ i(d) \end{pmatrix}$	$\begin{pmatrix} d \\ d \end{pmatrix}$	$\begin{pmatrix} i(d) \\ i(d) \\ i(d) \end{pmatrix}$	$\begin{pmatrix} d \\ d \\ d \end{pmatrix}$
Complex $\begin{pmatrix} d_1 \\ d_2 \end{pmatrix}$	$i(d_1)$	d_1		$\begin{pmatrix} i(d_1) \\ i(d_2) \end{pmatrix}$	$\begin{pmatrix} d_1 \\ d_2 \end{pmatrix}$	$\begin{pmatrix} i(d_1) \\ i(d_2) \\ 0 \end{pmatrix}$	$\begin{pmatrix} d_1 \\ d_2 \\ 0 \end{pmatrix}$
Vec2Int $\begin{pmatrix} i_1 \\ i_2 \end{pmatrix}$	i_1	$d(i_1)$	$\begin{pmatrix} d(i_1) \\ d(i_2) \end{pmatrix}$		$\begin{pmatrix} d(i_1) \\ d(i_2) \end{pmatrix}$	$\begin{pmatrix} i_1 \\ i_2 \\ 0 \end{pmatrix}$	$\begin{pmatrix} d(i_1) \\ d(i_2) \\ 0 \end{pmatrix}$
Vec2Double $\begin{pmatrix} d_1 \\ d_2 \end{pmatrix}$	$i(d_1)$	d_1	$\begin{pmatrix} d_1 \\ d_2 \end{pmatrix}$	$\begin{pmatrix} i(d_1) \\ i(d_2) \end{pmatrix}$		$\begin{pmatrix} i(d_1) \\ i(d_2) \\ 0 \end{pmatrix}$	$\begin{pmatrix} d_1 \\ d_2 \\ 0 \end{pmatrix}$
Vec3Int $\begin{pmatrix} i_1 \\ i_2 \\ i_3 \end{pmatrix}$	i_1	$d(i_1)$	$\begin{pmatrix} d(i_1) \\ d(i_2) \end{pmatrix}$	$\begin{pmatrix} i_1 \\ i_2 \end{pmatrix}$	$\begin{pmatrix} d(i_1) \\ d(i_2) \end{pmatrix}$		$\begin{pmatrix} d(i_1) \\ d(i_2) \\ d(i_3) \end{pmatrix}$
Vec3Double $\begin{pmatrix} d_1 \\ d_2 \\ d_3 \end{pmatrix}$	$i(d_1)$	d_1	$\begin{pmatrix} d_1 \\ d_2 \end{pmatrix}$	$\begin{pmatrix} i(d_1) \\ i(d_2) \end{pmatrix}$	$\begin{pmatrix} d_1 \\ d_2 \end{pmatrix}$	$\begin{pmatrix} i(d_1) \\ i(d_2) \\ i(d_3) \end{pmatrix}$	

The table shows conversions between arithmetic data types. An element in the table shows the result of casting the value in the leftmost column (on the same row) to the value on the top row (in the same column). *d(i)* is the normal promotion of `int` to `double` as defined in C++. *i(d)* is the normal conversion of `double` to `int`.

2.4 Unary operations on pixel values

Unary operations on $\mathbf{x} \in \{\mathbf{Z}^n, \mathbf{R}^n\}$:

dimension	$\dim(\mathbf{x}) = n$	scalar result
negation	$-\mathbf{x} = (-x_1, ..., -x_n)$	
complement	$\sim\mathbf{x} = (\sim x_1, ..., \sim x_n)$	one's complement, integer only
abs	$\lvert\mathbf{x}\rvert = (\lvert x_1\rvert, ..., \lvert x_n\rvert)$	
ceil	$\lceil\mathbf{x}\rceil = (\lceil x_1\rceil, ..., \lceil x_n\rceil)$	
floor	$\lfloor\mathbf{x}\rfloor = (\lfloor x_1\rfloor, ..., \lfloor x_n\rfloor)$	
round	$[\mathbf{x}] = ([x_1], ..., [x_n])$	
projection	$p_i(\mathbf{x}) = x_i$	scalar result
sum	$\sum\mathbf{x} = x_1 + ... + x_n$	scalar result
product	$\prod\mathbf{x} = x_1 ... x_n$	scalar result
minimum	$\wedge\mathbf{x} = x_1 \wedge ... \wedge x_n$	scalar result
maximum	$\vee\mathbf{x} = x_1 \vee ... \vee x_n$	scalar result
L^1 norm	$\lvert\lvert\mathbf{x}\rvert\rvert_1 = \lvert x_1\rvert + ... + \lvert x_n\rvert$	cityblock, scalar result
L^2 norm	$\lvert\lvert\mathbf{x}\rvert\rvert_2 = \sqrt{{x_1}^2 + ... + {x_n}^2}$	Euclidian, floating point scalar
L^∞ norm	$\lvert\lvert\mathbf{x}\rvert\rvert_\infty = \lvert x_1\rvert \vee ... \vee \lvert x_n\rvert$	chessboard, scalar result
square root	$\sqrt{\mathbf{x}} = (\sqrt{x_1}, ..., \sqrt{x_n})$	floating point result
sine	$\sin(\mathbf{x}) = (\sin(x_1), ..., \sin(x_n))$	floating point result
cosine	$\cos(\mathbf{x}) = (\cos(x_1), ..., \cos(x_n))$	floating point result
tangent	$\tan(\mathbf{x}) = (\tan(x_1), ..., \tan(x_n))$	floating point result
arc sine	$\mathrm{asin}(\mathbf{x}) = (\mathrm{asin}(x_1), ..., \mathrm{asin}(x_n))$	floating point result
arc cosine	$\mathrm{acos}(\mathbf{x}) = (\mathrm{acos}(x_1), ..., \mathrm{acos}(x_n))$	floating point result
arc tangent	$\mathrm{atan}(\mathbf{x}) = (\mathrm{atan}(x_1), ..., \mathrm{atan}(x_n))$	floating point result
arc tangent	$\mathrm{atan2}(\mathbf{x}) = \mathrm{atan2}(x_1, x_2)$	n = 2 only, floating point scalar
hyperbolic sin	$\sinh(\mathbf{x}) = (\sinh(x_1), ..., \sinh(x_n))$	floating point result
hyperbolic cos	$\cosh(\mathbf{x}) = (\cosh(x_1), ..., \cosh(x_n))$	floating point result
hyperbolic tan	$\tanh(\mathbf{x}) = (\tanh(x_1), ..., \tanh(x_n))$	floating point result
exponent	$\exp(\mathbf{x}) = (e^{x_1}, ..., e^{x_n})$	floating point result
natural log	$\log(\mathbf{x}) = (\log_e(x_1), ..., \log_e(x_n))$	floating point result
base 10 log	$\log 10(\mathbf{x}) = (\log_{10}(x_1), ..., \log_{10}(x_n))$	floating point result

The unary pixel operations are defined for all arithmetic datatypes.

2.5 Binary operations on pixel values

Binary operations on $\mathbf{x}, \mathbf{y} \in \{\mathbf{Z}^n, \mathbf{R}^n\}$:

addition	$\mathbf{x} + \mathbf{y} = (x_1 + y_1, ..., x_n + y_n)$	
subtraction	$\mathbf{x} - \mathbf{y} = (x_1 - y_1, ..., x_n - y_n)$	
multiplication	$\mathbf{x} * \mathbf{y} = (x_1 y_1, ..., x_n y_n)$	Hadamard product
division	$\mathbf{x}/\mathbf{y} = (x_1/y_1, ..., x_n/y_n)$	
minimum	$\mathbf{x} \wedge \mathbf{y} = \begin{cases} \mathbf{x} & \text{if } \mathbf{x} < \mathbf{y} \\ \mathbf{y} & \text{otherwise} \end{cases}$	
maximum	$\mathbf{x} \vee \mathbf{y} = \begin{cases} \mathbf{x} & \text{if } \mathbf{x} > \mathbf{y} \\ \mathbf{y} & \text{otherwise} \end{cases}$	
infimum	$\mathbf{x} \wedge \mathbf{y} = (x_1 \wedge y_1, ..., x_n \wedge y_n)$	
supremum	$\mathbf{x} \vee \mathbf{y} = (x_1 \vee y_1, ..., x_n \vee y_n)$	
power	$\mathbf{x}^{\mathbf{y}} = (x_1^{y_1}, ..., x_n^{y_n})$	
modulo	$\mathbf{x} \,\%\, \mathbf{y} = (x_1 \,\%\, y_1, ..., x_n \,\%\, y_n)$	integer only
and	$\mathbf{x} \,\&\, \mathbf{y} = (x_1 \,\&\, y_1, ..., x_n \,\&\, y_n)$	integer only
or	$\mathbf{x} \mid \mathbf{y} = (x_1 \mid y_1, ..., x_n \mid y_n)$	integer only
xor	$\mathbf{x} \,\hat{}\, \mathbf{y} = (x_1 \,\hat{}\, y_1, ..., x_n \,\hat{}\, y_n)$	integer only
left shift	$\mathbf{x} \ll \mathbf{y} = (x_1 \ll y_1, ..., x_n \ll y_n)$	integer only
right shift	$\mathbf{x} \gg \mathbf{y} = (x_1 \gg y_1, ..., x_n \gg y_n)$	integer only
dot	$\mathbf{x} \cdot \mathbf{y} = x_1 y_1 + ... + x_n y_n$	scalar result
cross	$\mathbf{x} \times \mathbf{y} = (x_2 y_3 - x_3 y_2, ...)$	n = 3 only
equal	$\mathbf{x} = \mathbf{y}$	scalar result
not equal	$\mathbf{x} \neq \mathbf{y}$	scalar result

The comparison operations given below are for $n > 1$.
For $n = 1$ the standard definition is used.

less than	$\mathbf{x} < \mathbf{y} = \begin{cases} 1 & \text{if } \|\|\mathbf{x}\|\|_1 < \|\|\mathbf{y}\|\|_1 \\ 0 & \text{otherwise} \end{cases}$	scalar result
greater than	$\mathbf{x} > \mathbf{y} = \begin{cases} 1 & \text{if } \|\|\mathbf{x}\|\|_1 > \|\|\mathbf{y}\|\|_1 \\ 0 & \text{otherwise} \end{cases}$	scalar result
less equal	$\mathbf{x} \leq \mathbf{y} = \begin{cases} 1 & \text{if } \|\|\mathbf{x}\|\|_1 \leq \|\|\mathbf{y}\|\|_1 \\ 0 & \text{otherwise} \end{cases}$	scalar result
greater equal	$\mathbf{x} \geq \mathbf{y} = \begin{cases} 1 & \text{if } \|\|\mathbf{x}\|\|_1 \geq \|\|\mathbf{y}\|\|_1 \\ 0 & \text{otherwise} \end{cases}$	scalar result

The binary pixel operations are defined for all arithmetic datatypes.

2.6 Color operations on pixel values

The supported color models are enumerated in **HxColorModel** (p. 107). Color semantics are defined in **HxColor** (p. 498).

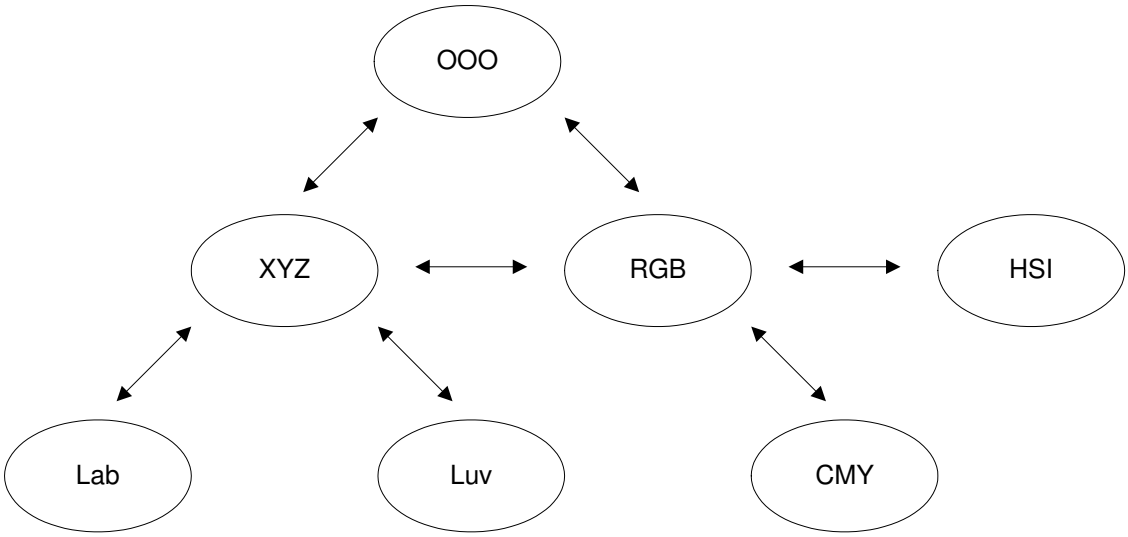

Figure 2.1: Color spaces

Functions for conversion of colors from one color space to another

RGB <-> CMY : **HxColRGB2CMY** (p. 101) and **HxColCMY2RGB** (p. 101).

RGB <-> XYZ : **HxColRGB2XYZ** (p. 101) and **HxColXYZ2RGB** (p. 102).

CMY <-> XYZ : **HxColCMY2XYZ** (p. 102) and **HxColXYZ2CMY** (p. 102).

Lab <-> XYZ : **HxColLab2XYZ** (p. 102) and **HxColXYZ2Lab** (p. 103).

Luv <-> XYZ : **HxColLuv2XYZ** (p. 103) and **HxColXYZ2Luv** (p. 103).

RGB <-> OOO : **HxColRGB2OOO** (p. 104) and **HxColOOO2RGB** (p. 104).

XYZ <-> OOO : **HxColXYZ2OOO** (p. 104) and **HxColOOO2XYZ** (p. 104).

RGB <-> HSI : **HxColRGB2HSI** (p. 105) and **HxColHSI2RGB** (p. 105).

Chapter 3

Images

3.1 Images

Our definition of images and operations on images is given in **Image definition and generic operations** (p. 8).

More down to earth, image data is stored in an **HxImageRep** (p. 620) and processed via functions such as listed in **Global image functions** (p. 10).

If you really want to know what is going on, see **Image data representation** (p. 12) and **The way image operations work** (p. 15).

This chapter:

3.2 Image definition and generic operations

3.3 Images and semantics

The use of images include:

- intensity images: the pixel value indicates a monochrome light intensity
- color images: the pixel value represents a color (RGB, HSI, etc.)

- X-ray, ultrasound, or electron microscope images: a pixel value depends on object density or another physical phenomena
- satellite images: the pixel value represents a recording of up to 7 spectral bands
- range images: the pixel value indicates a distance
- characteristic images: the pixel value indicates whether the pixel is element of a set
- flow fields: the pixel value represents a motion vector
- complex images: FFT domain

As stated in the introduction, we strive for a separation between semantics, representation, and implementation of objects. The representation is to provide a "neutral" view of a concept, a more or less mathematical view on the functionality needed in dealing with instances of the concept. From a software design point of view, representation and associated functionality is more important than semantics because it provides most opportunities for reusability. After all, you could say that semantics is nothing more than a label assigned to a representation.

Figure 3.1: Images in Horus

In Horus images are represented by the class **HxImageRep** (p. 620). The actual image data is stored in **HxImageData** (p. 581). The class `Image with semantics` is used to associate semantics with the pixel values, i.e. what does the numerical value of a pixel actually mean. The current implementation does not provide a class for semantics.

3.4 Image definition

A digital image consists of a set of pixels. Associated with each pixel is a location (point) $\mathbf{x}$ and a (pixel) value $\mathbf{a}(\mathbf{x})$. The set of all points $\mathbf{x}$ is referred to as the domain of the image, and is denoted by $\mathbf{X}$. Usually, $\mathbf{X}$ is an n-dimensional lattice with $n = 1, 2,$ or 3. Also, the point set is bounded in each dimension resulting in a rectangular shape for $n = 2$ and a block shape for $n = 3$. That is, for a 2-dimensional $w \times h$ image $\mathbf{X} = \mathbf{Z}_w \times \mathbf{Z}_h = \{(x_1, x_2) \in \mathbf{Z}^2 : 0 \leq x_1 \leq w-1, 0 \leq x_2 \leq h-1\}$ ($\mathbf{Z}_n = \{0, 1, ..., n-1\}$).

The set of all pixel values $\mathbf{a}(\mathbf{x})$ is referred to as the *range* of an image, and is denoted by $\mathbf{F}$. A pixel value is a scalar value or a vector of n scalar values (usually $n = 2$ or 3). A scalar value is represented by one of the following:

- a k bits integer value (bit, byte, short, int, ...)
- a k bits floating point value (float, double, ...)
- a complex number

For example, for color pixels represented by RGB values $\mathbf{F} = \mathbf{Z}_{2^k} \times \mathbf{Z}_{2^k} \times \mathbf{Z}_{2^k}$ (typically $k = 8$). In summary, an image $\mathbf{a}$ is a shorthand notation for $\{(\mathbf{x}, \mathbf{a}(\mathbf{x})) : \mathbf{x} \in \mathbf{Z}^n (n = 1, 2, 3), \mathbf{a}(\mathbf{x}) \in \{\mathbf{Z}^n, \mathbf{R}^n, \mathbf{C}\} (n = 1, 2, 3)\}$.

In case the pixels in an n-dimensional image contain multiple values (say m values) we often encounter two different ways of addressing the image content. The first way is to regard the image to be an n-dimensional field of m-dimensional vectors, i.e.

$$\mathbf{a} = \{(\mathbf{x}, \mathbf{a}(\mathbf{x})) : \mathbf{x} \in \mathbf{Z}^n, \mathbf{a}(\mathbf{x}) \in \mathbf{F}_1 \times \mathbf{F}_2 \times ... \times \mathbf{F}_m\}$$

The second way is to regard the image to be a set of m n-dimensional fields of scalars:

$$\mathbf{a} = \{\mathbf{a}_1, \mathbf{a}_2, ..., \mathbf{a}_m\} \text{ with } \mathbf{a}_i = \{(\mathbf{x}, \mathbf{a_i}(\mathbf{x})) : \mathbf{x} \in \mathbf{Z}^n, \mathbf{a_i}(\mathbf{x}) \in \mathbf{F}_i\}$$

We take the former way the basic representation of vector images in our system. The latter way is also supported by means of projection functions but then the user has to keep track of the set of scalar images that represent a single vector image.

3.5 Generic image operations

- unary pixel operations: $\mathbf{c} = f(\mathbf{a}) = \{(\mathbf{x}, \mathbf{c}(\mathbf{x})) : \mathbf{c}(\mathbf{x}) = f(\mathbf{a}(\mathbf{x})), \mathbf{x} \in \mathbf{X}\}$, with f a unary operation on $\mathbf{F}$.
- binary pixel operations: $\mathbf{c} = \mathbf{a}\gamma\mathbf{b} = \{(\mathbf{x}, \mathbf{c}(\mathbf{x})) : \mathbf{c}(\mathbf{x}) = \mathbf{a}(\mathbf{x})\gamma\mathbf{b}(\mathbf{x})), \mathbf{x} \in \mathbf{X}\}$, with γ a binary operation on $\mathbf{F}$.

  The operand may also be a scalar k: $\mathbf{c} = \mathbf{a}\gamma k = \{(\mathbf{x}, \mathbf{c}(\mathbf{x})) : \mathbf{c}(\mathbf{x}) = \mathbf{a}(\mathbf{x})\gamma k), \mathbf{x} \in \mathbf{X}\}$
- reduce operations: $\Gamma\mathbf{a} = \Gamma_{\mathbf{x}\in\mathbf{X}}\mathbf{a}(\mathbf{x}) = \Gamma_{i=1}^{n}\mathbf{a}(x_i) = \mathbf{a}(x_1)\gamma\mathbf{a}(x_2)\gamma...\gamma\mathbf{a}(x_n)$, with γ an associative and commutative binary operation on $\mathbf{F}$.
- generalized convolution: $\mathbf{c} = \mathbf{a} \textcircled{\gamma} \mathbf{t} = \{(\mathbf{x}, \mathbf{c}(\mathbf{x})) : \mathbf{c}(\mathbf{x}) = \mathbf{\Gamma}_{\mathbf{y}\in\mathbf{Y}}\mathbf{a}(\mathbf{x}-\mathbf{y}) \bigcirc \mathbf{t}(\mathbf{y}), \mathbf{x} \in \mathbf{X}\}$, with $\bigcirc$ and γ binary operations on $\mathbf{F}$, and $\mathbf{t} = \{(\mathbf{y}, \mathbf{t}(\mathbf{y})) : \mathbf{y} \in \mathbf{Y}\}$. Here, $\mathbf{Y} = \mathbf{Z}_{\pm w} \times \mathbf{Z}_{\pm h} \times \mathbf{Z}_{\pm d} = \{(x_1, x_2, x_3) \in \mathbf{Z}^3 : -w+1 \le x_1 \le w-1, -h+1 \le x_2 \le h-1, -d+1 \le x_3 \le d-1\}$ ($\mathbf{Z}_{\pm n} = \{-n+1, ..., -1, 0, 1, ..., n-1\}$). In order for a template operation to be applied near the edge of an image a frame is added. Pixel values in a frame are set to the zero-element in the computation, by mirroring pixel values across the edge of an image, or by tiling the image data.
- neighbourhood operations: $\mathbf{c} = \mathbf{a} \textcircled{\Lambda} N = \{(\mathbf{x}, \mathbf{c}(\mathbf{x})) : \mathbf{c}(\mathbf{x}) = \Lambda_{\mathbf{y}\in N}\mathbf{a}(\mathbf{x}-\mathbf{y}), \mathbf{x} \in \mathbf{X}\}$, with N a neighbourhood ($N : \mathbf{X} \to 2^{\mathbf{X}}$) and Λ a reduce operation on the pixel values in a set ($\Lambda : (\mathbf{X}, \mathbf{F}) \to \mathbf{F}$). Note : Λ is more general than Γ in that Λ need not be defined in terms of a binary operation on $\mathbf{F}$.
- recursive neighbourhood operations: Apply neighbourhood operation repeatedly until no more changes occur. The operation can depend upon the scan direction in which the neighbourhood operation is applied.
- geometric (domain) operations: $\mathbf{c} = \mathbf{a} \circ f = \{(\mathbf{x}, \mathbf{c}(\mathbf{x})) : \mathbf{c}(\mathbf{x}) = \mathbf{a}(f(\mathbf{x})), \mathbf{x} \in \mathbf{X}\}$, with f a unary operation on $\mathbf{X}$.

3.6 Global image functions

Arithmetic unary **HxAbs** (p. 75), **HxCeil** (p. 97), **HxComplement** (p. 108), **HxExp** (p. 135), **HxFloor** (p. 144), **HxLog** (p. 273), **HxLog10** (p. 274), HxLut, **HxNegate** (p. 304), **HxNorm1** (p. 306), **HxNorm2** (p. 306), **HxNorm2Sqr** (p. 307), **HxNormInf** (p. 308), **HxProjectRange** (p. 329), **HxReciprocal** (p. 331), **HxSqrt** (p. 355), **HxRound** (p. 343), **HxUnaryMax** (p. 375), **HxUnaryMin** (p. 375), **HxUnaryProduct** (p. 376), **HxUnarySum** (p. 376)

trigonometric **HxAcos** (p. 76), **HxArg** (p. 89), **HxAsin** (p. 90), **HxAtan** (p. 91), **HxAtan2** (p. 92), **HxConjugate** (p. 111), **HxCos** (p. 119), **HxCosh** (p. 119), **HxSin** (p. 351), **HxSinh** (p. 352), **HxTan** (p. 367), **HxTanh** (p. 368).

binary **HxAdd** (p. 77), **HxAddSat** (p. 81), **HxAnd** (p. 86), **HxCross** (p. 120), **HxDiv** (p. 126), **HxDot** (p. 130), **HxEqual** (p. 133), **HxGreaterEqual** (p. 232), **HxGreaterThan** (p. 234), **HxInf** (p. 259), **HxInverseProjectRange** (p. 262), **HxLeftShift** (p. 265), **HxLessEqual** (p. 268), **HxLessThan** (p. 270), **HxMax** (p. 294), **HxMin** (p. 296), **HxMod** (p. 298), **HxMul** (p. 302), **HxNotEqual** (p. 309), **HxOr** (p. 315), **HxPow** (p. 327), **HxRightShift** (p. 340), **HxSub** (p. 359), **HxSubSat** (p. 360), **HxSup** (p. 362), **HxXor** (p. 396).

3.7 Image data representation

This section will be updated when the move to image functors has been completed.

The **HxImageRep** (p. 620) and **HxImageData** (p. 581) classes, etc.

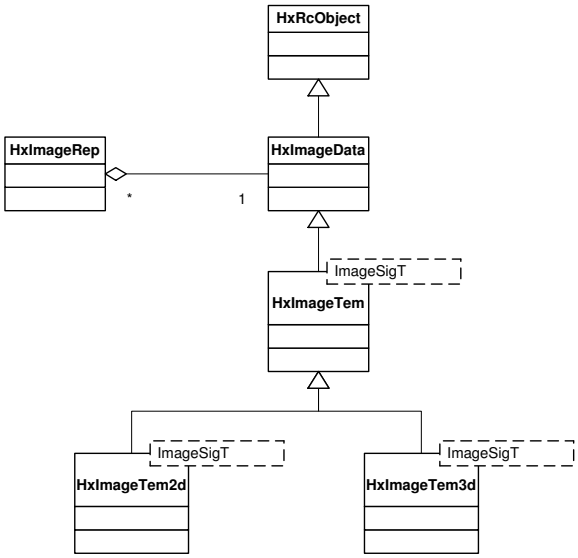

Figure 3.2: Image class hierarchy

HxImageFactory (p. 605), HxImageCreator, and HxDataPtrCreator.

HxPixelAllocator (p. 1072)

Wich image types are available : **Image signatures** (p. 13) and instantiations.

3.7.1 Image signatures

The signature of an image gives a description of the characteristics of an image type (a class). Part of the description contains runtime information and is universally accessible through the base class **HxImageSignature** (p. 685). The other part contains compile time information and is accessible only in specializations of **HxImageSignature** (p. 685).

The universally accessible part is obtained by members of **HxImageSignature** (p. 685):

- **HxImageSignature::imageDimensionality** (p. 691) : The dimensionality of an image, currently 1, 2, or 3.
- **HxImageSignature::pixelDimensionality** (p. 691) : The dimensionality of the pixel values in the image, currently 1 (scalar value), 2 (vector of 2 scalars), or 3 (vector of 3 scalars).
- **HxImageSignature::pixelType** (p. 691) : The type of the pixel values: INT, REAL, or COMPLEX.
- **HxImageSignature::pixelPrecision** (p. 691) : The number of bits used in the representation of a pixel value, currently 8, 16, 32, or 64.

Specializations of **HxImageSignature** (p. 685) provide additional information on the static types needed in the implementation of image processing operations by means of typedefs:

- **PixelType** The type of the actual pixel values stored in the image (see **Pixel value representation** (p. 3)).
- **ArithType** The type used in the evaluation of arithmetic operations on pixel values (see **Arithmetic data types** (p. 3)).

- **ArithTypeDouble** The type used in the evaluation of arithmetic operations on pixels in combination with other values that are represented as reals, e.g. in template operations with a kernel specified in `doubles`. May be the same as ArithType.
- **DataPtrType** The type of a data pointer to this image type (see **Image data pointers** (p. 15)).
- **Allocator** The type of a pixel allocator for this image type.
- **ProjectDomainImageSigType** The type (signature) of an image that is the result of the domain projection operation.
- **ArithImageSigType** The signature with the same image dimensionality but based on ArithType instead of PixelType.
- **ArithImageSigTypeDouble** The signature with the same image dimensionality but based on ArithTypeDouble.

The list of signatures

2D images with pixels represented by a scalar value **HxImageSig2dByte** (p. 669), **HxImageSig2dDouble** (p. 671), **HxImageSig2dFloat** (p. 672), **HxImageSig2dInt** (p. 672), **HxImageSig2dShort** (p. 673).

2D images with pixels represented by a complex number **HxImageSig2dComplex** (p. 670).

2D images with pixels represented by a vector of 2 scalars **HxImageSig2dVec2Byte** (p. 674), **HxImageSig2dVec2Double** (p. 675), **HxImageSig2dVec2Float** (p. 675), **HxImageSig2dVec2Int** (p. 676), **HxImageSig2dVec2Short** (p. 677).

2D images with pixels represented by a vector of 3 scalars **HxImageSig2dVec3Byte** (p. 678), **HxImageSig2dVec3Double** (p. 678), **HxImageSig2dVec3Float** (p. 679), **HxImageSig2dVec3Int** (p. 680), **HxImageSig2dVec3Short** (p. 681).

3D images with pixels represented by a scalar value **HxImageSig3dByte** (p. 681), **HxImageSig3dDouble** (p. 682), **HxImageSig3dFloat** (p. 683), **HxImageSig3dInt** (p. 684), **HxImageSig3dShort** (p. 684).

An overview of the currently available image types and the associated PixelType, ArithType, and ArithTypeDouble.

ImageType	PixelType	ArithType	ArithTypeDouble
HxImage2dByte	**HxByte** (p. 93)	**HxScalarInt** (p. 1164)	**HxScalarDouble** (p. 1145)
HxImage2dShort	short	**HxScalarInt** (p. 1164)	**HxScalarDouble** (p. 1145)
HxImage2dInt	int	**HxScalarInt** (p. 1164)	**HxScalarDouble** (p. 1145)
HxImage2dFloat	float	**HxScalarDouble** (p. 1145)	**HxScalarDouble** (p. 1145)
HxImage2dDouble	double	**HxScalarDouble** (p. 1145)	**HxScalarDouble** (p. 1145)
HxImage2dComplex	**HxComplex** (p. 506)	**HxComplex** (p. 506)	**HxComplex** (p. 506)
HxImage2dVec2Byte	**HxVec2Byte** (p. 381)	**HxVec2Int** (p. 1281)	**HxVec2Double** (p. 1262)
HxImage2dVec2Short	**HxVec2Short** (p. 382)	**HxVec2Int** (p. 1281)	**HxVec2Double** (p. 1262)
HxImage2dVec2Int	**HxVec2Int** (p. 1281)	**HxVec2Int** (p. 1281)	**HxVec2Double** (p. 1262)
HxImage2dVec2Float	**HxVec2Float** (p. 382)	**HxVec2Double** (p. 1262)	**HxVec2Double** (p. 1262)
HxImage2d-Vec2Double	**HxVec2Double** (p. 1262)	**HxVec2Double** (p. 1262)	**HxVec2Double** (p. 1262)
HxImage2dVec3Byte	**HxVec3Byte** (p. 383)	**HxVec3Int** (p. 1321)	**HxVec3Double** (p. 1301)
HxImage2dVec3Short	**HxVec3Short** (p. 384)	**HxVec3Int** (p. 1321)	**HxVec3Double** (p. 1301)
HxImage2dVec3Int	**HxVec3Int** (p. 1321)	**HxVec3Int** (p. 1321)	**HxVec3Double** (p. 1301)
HxImage2dVec3Float	**HxVec3Float** (p. 383)	**HxVec3Double** (p. 1301)	**HxVec3Double** (p. 1301)
HxImage2d-Vec3Double	**HxVec3Double** (p. 1301)	**HxVec3Double** (p. 1301)	**HxVec3Double** (p. 1301)
HxImage3dByte	**HxByte** (p. 93)	**HxScalarInt** (p. 1164)	**HxScalarDouble** (p. 1145)
HxImage3dShort	short	**HxScalarInt** (p. 1164)	**HxScalarDouble** (p. 1145)
HxImage3dInt	int	**HxScalarInt** (p. 1164)	**HxScalarDouble** (p. 1145)
HxImage3dFloat	float	**HxScalarDouble** (p. 1145)	**HxScalarDouble** (p. 1145)
HxImage3dDouble	double	**HxScalarDouble** (p. 1145)	**HxScalarDouble** (p. 1145)

3.7.2 Image data pointers

Image data is accessed through data pointers (a variable of type `DataPtrType`). The `DataPtrType` is defined in the signature of an image (see **Image signatures** (p. 13)).

Typically, the data pointer type is (a specialization of) a template class with (trivial) inline member functions. The inline functions are eliminated through compiler optimization so there is no loss of efficiency in pixel manipulation. To keep the functions trivial and efficient issues such as border checking should not be done within member functions of the data pointer class.

The requirements for the `DataPtrType` expressed as a class definition are:

```
                        DataPtrType(const DataPtrType& rhs);

DataPtrType&            operator=(const DataPtrType& rhs);

void                    incX();
void                    decX();
void                    incY();
void                    decY();
void                    incZ();
void                    decZ();
void                    incX(int off);
void                    decX(int off);
void                    incY(int off);
void                    decY(int off);

void                    incXYZ(int xOff, int yOff, int zOff = 0);
void                    decXYZ(int xOff, int yOff, int zOff = 0);

ArithT                  read();
void                    write(const ArithT& val);
ArithT                  readIncX();
void                    writeIncX(const ArithT& val);

PixelT*                 data();
```

Horus provides three template classes fullfilling the requirements: **HxDataPtr2dScalarTem** (p. 526), **HxDataPtr2dTem** (p. 527), and **HxDataPtr3dScalarTem** (p. 528). The first two are optimized for 2D images, the last is for 3D images. There are two versions for 2D images (one for scalar pixel values and one for vector values) because of a small technical problem : the scalar values images use native types (short, int, float, and double) and one cannot define a constructor for these types.

Storage and retrieval of individual pixel values is done through the `read` and `write` member functions of the data pointer class. Outside the data pointer class pixel values are represented in one of the arithmetic data types (see **Arithmetic data types** (p. 3)).

3.8 The way image operations work

This is a description of the interaction between the various concepts that work together to implement an image processing operation. The description servers as a road map for analysis of the implementation. Also, it shows where the user is actually interacting with the infrastructure when a new image processing operation is being implemented.

To make the description more concrete, we trace the implementation of HxAbs. Note that you can easily trace the implementation of any operation in **Global image functions** (p. 10) via the source code incorporated in the documentation.

(1) Global image functions : (HxAbs (p. 75)**)** Operations on images are invoked via a global function (see **Global image functions** (p. 10) for an overview). Basically, a global function is a wrapper around an **HxImageRep** (p. 620) member function that may do some prior initialization and translation of parameters.

So, **HxAbs** (p. 75) calls **HxImageRep::unaryPixOp** (p. 629).

(2) HxImageRep member functions (HxImageRep::unaryPixOp (p. 629)**)** The member functions of **HxImageRep** (p. 620) match the generic operations on images and their variations listed in **Image processing patterns and variations** (p. 24). The most important task of the member function itself

is to instantiate a method frame (see **Method frames** (p. 19) for an overview) to enfore the 'value' paradigm and to allow for heterogenous image types. To start the actual operation, the call is forwarded to **HxImageData** (p. 581).

So, **HxImageRep::unaryPixOp** (p. 629) calls **HxImageData::unaryPixOp** (p. 593).

(3) HxImageData member functions (HxImageData::unaryPixOp (p. 593)**)** The member functions of **HxImageData** (p. 581) try to locate the approriate image functor (see **Image functors** (p. 21) for an overview). Lookup is based on a key. A key is constructed from the signature of the object image (this image) image and the name of the image functor. When present in the function, other image parameters may also be incorporated in the key. Note that the type of the key is "linked" to the member function. For example, unaryPixOp uses **HxImgFtorUpoKey** (p. 861).

With the key, an image functor is searched for in the functor table and downcast to the level of "I-nary" functors (see **Image functors** (p. 21)). The functor found is given the task of invoking the actual functor (the "real" functor, see **Image functors** (p. 21)) via callIt.

So, **HxImageData::unaryPixOp** (p. 593) calls **HxImgFtorI2::callIt** (p. 743).

(4) "I-nary" level image functors (HxImgFtorI2::callIt (p. 743)**)** This is actually a pure virtual member function. It is implemented one level lower in the tree (the "cast" level) by a template class.

So, we end up in **HxImgFtorI2Cast::callIt** (p. 749).

(5-1) "cast" level image functors (HxImgFtorI2Cast::callIt (p. 749)**)** At the "cast" level, the polymorphic **HxImageData** (p. 581) parameters are converted to statically typed data pointer parameters. The data pointer parameters are passed to the doIt function of the same class.

So, **HxImgFtorI2Cast::callIt** (p. 749) calls **HxImgFtorI2Cast::doIt** (p. 750).

(5-2) "cast" level image functors (HxImgFtorI2Cast::doIt (p. 750)**)** This is actually a pure virtual member function. It is implemented at the lowest level in the tree by the "real functor".

So, we end up in **HxImgFtorUpo::doIt** (p. 861).

(6) "real" image functors (HxImgFtorUpo::doIt (p. 861)**)** The "real" functors introduce additional information for the pattern to work, typically in the form of template parameters. The number and type of the template parameters depend upon the pattern. For example, **HxImgFtorUpo** (p. 859) has only one : UpoT.

The template parameters may use information from the tag list for run-time initialization. To that end, the tag list is passed to the constructor of the template parameter.

Variations on patterns are typically specified through typedefs in a template parameter. Based on these typedefs, the appropriate global template function is selected to do the actual work. The selection is done by a separate global template function called a dispatch function.

So, **HxImgFtorUpo::doIt** (p. 861) calls **HxFuncUpoDispatch** (p. 225)

(7-1) global dispatch functions (HxFuncUpoDispatch (p. 225)**)** A dispatch function is a global template function that selects the appropriate global template function implementing a variation on a pattern via typedefs in a template parameter.

The unary pixel operation has two variations : translation variant and translation invariant. The variation is defined by the TransVarianceCategory typedef in the UpoT template parameter.

So **HxFuncUpoDispatch** (p. 225) calls **HxFuncUpo**(DstDataPtrT,SrcDataPtrT,HxSizes,UpoT&,HxTagTransInVar) (p. 224) or **HxFuncUpo**(DstDataPtrT,SrcDataPtrT,HxSizes,UpoT&,HxTagTransVar) (p. 225).

(7-2) global image processing functions (HxFuncUpo (p. 225)**)** At last, we have come to the function that actually implements the pattern and does some image processing. That is, the function implements "the loop over all pixels in the image" and calls the user defined functor(s) at the pre-defined moments.

Note that two times a virtual function was used to go down in the functor hierarchy. Ensuring the ”right” path is enforced by the instantiations of the actual image functors and the keys. See **HxInstantiatorAbs.c** (p. **??**) for the instantiations of our HxAbs example.

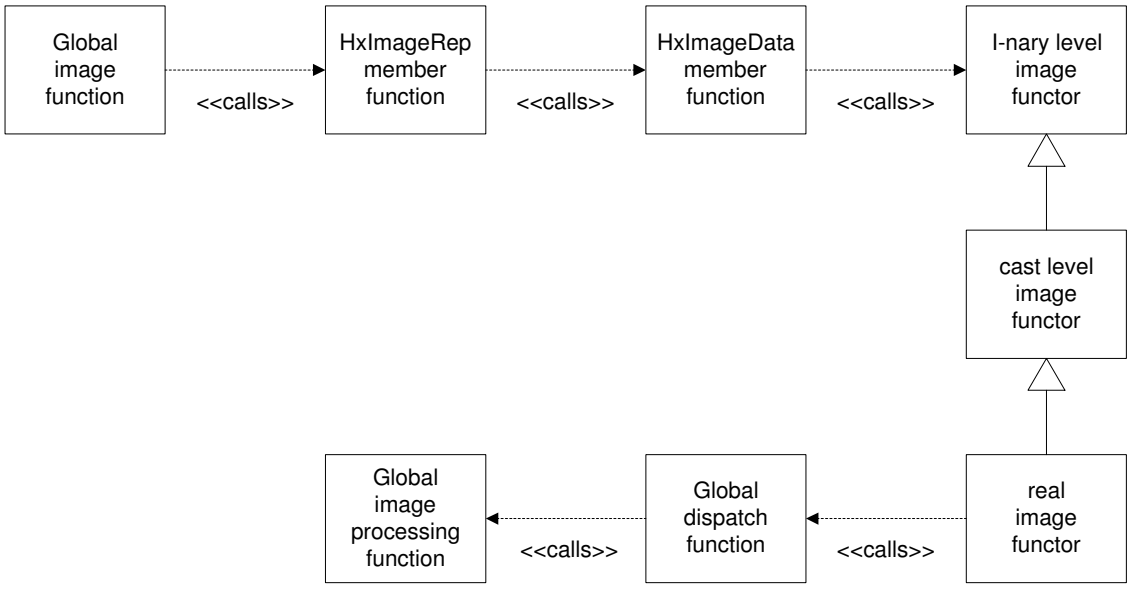

Figure 3.3: Graphical overview of the way image processing works

3.8.1 Image processing patterns and variations

The ”thing” that defines a pattern is the functor. Naming conventions for functors are geared towards the image parameters involved. This sometimes introduces confusion as, for example, a binary pixel operation applied to an image and a constant value is actually implemented by the unary pixel operation pattern (because there is only one image parameter involved).

- **Unary pixel operation** (p. 26)
  - **Translation invariant unary pixel operation** (p. 26)
  - **Translation variant unary pixel operation** (p. 27)
- **Binary pixel operation** (p. 28)
  - **Translation invariant binary pixel operation** (p. 28)
  - **Translation variant binary pixel operation** (p. 29)
- **Multi operation** (p. 29)
  - **Translation invariant multi pixel operation** (p. 30)
  - **Translation variant multi pixel operation** (p. 30)
- **M output, N input pixel operation** (p. 31)
  - **Translation invariant M output, N input pixel operation** (p. 31)
  - **Translation variant M output, N input pixel operation** (p. 32)
- **In/Out pixel operation** (p. 33)
  - **Translation invariant, 1 phase pixel export operation** (p. 33)
  - **Translation variant, 1 phase pixel export operation** (p. 34)

Not addressable via the HxImageRep interface (for internal use only):

To be re-written:

- **Geometric operation on 2D images** (p. 62)
- Display RGB operation
  - **Display RGB operation for 2D images** (p. 62)
  - **Display RGB operation for 3D images** (p. 63)

3.8.2 Method frames

Method frames are used in **HxImageRep** (p. 620) member functions to enforce the 'value' or 'functional' paradigm. That is, each operation that would change the operand object results in a new object.

Method frames also faciliate operations on heterogeneous image types. In other words, method frames ensure that the image types (signatures) of all images involved in an operation "match". The image types involved in an operation are the object itself, all of its image parameters and the result of the operation. These types must match the signatures used to instantiate the image functor that is going to be called by the member function otherwise the operation cannot be executed. Method frames try to make a match based on information in the so-called rule base (**HxImgFtorRuleBase** (p. 840)). In case there is no exact match, the method frames will adjust image types by creating temporary variables of the appropriate image type and initializing them with data from the corresponding image. The method frames also allocate a result image of the appropriate type.

A method frame is initialized typically with a pointer to the data, i.e. an instantiation of **HxImageData** (p. 581), obtained via HxImageRep::pointee(). The constructor of the method frame takes care of possible allocation of temporary image data and conversion of image data according to the task of the frame. The specific copy and/or conversion schemes are hidden from the method frame class user by the `object`, `argument`, `kernel`, and `result` member functions. After construction of the method frame, the user should use only these functions to access the image data of the object as well as possible arguments. The result of the operation is typically an instantiation of **HxImageRep** (p. 620) intialized with the `result` of the method frame. The destructor of the method frame removes temporary images.

The list of method frames

- **HxMfBpo** (p. 1006)
- **HxMfDiy** (p. 1009)

- **HxMfIdentity** (p. 1016)
- **HxMfKernelNgb** (p. 1018)
- **HxMfMNpo** (p. 1020)
- **HxMfMpo** (p. 1024)
- **HxMfNgb** (p. 1026)
- **HxMfResize** (p. 1031)
- **HxMfUpo** (p. 1033)

3.8.3 Border handling

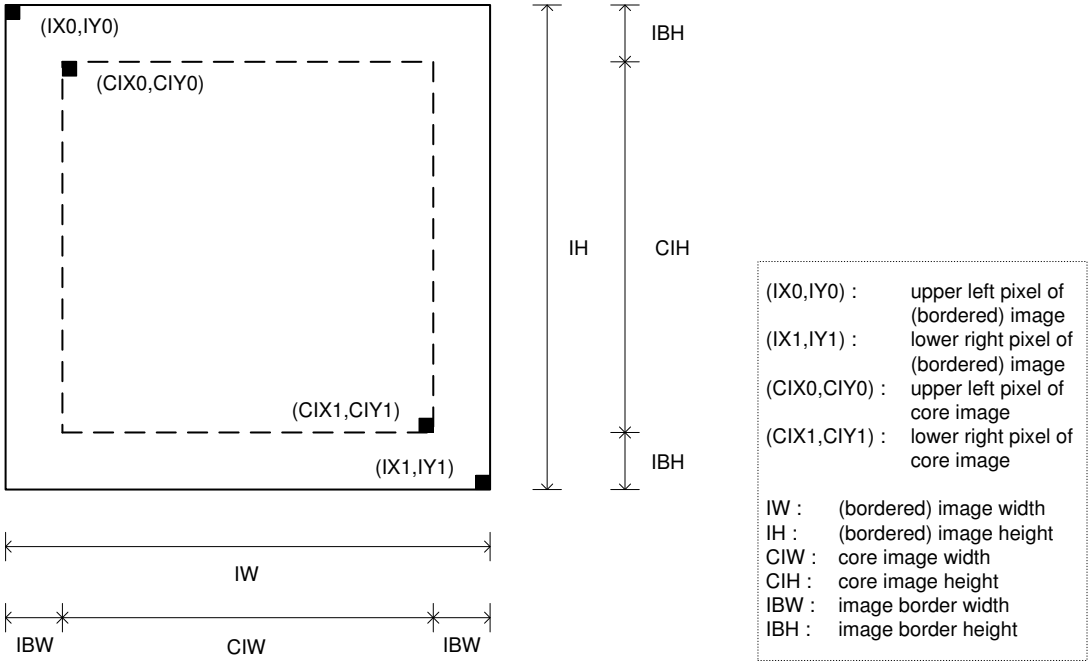

Figure 3.4: Image border definition

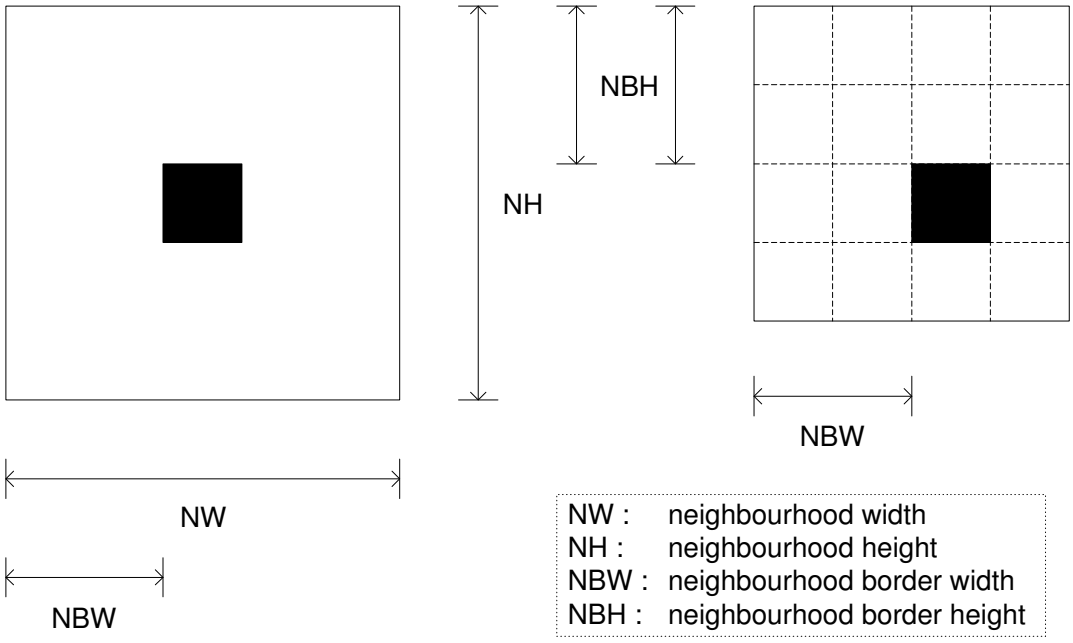

Figure 3.5: Neighbourhood border definition

- (bordered) image sizes : IS = (IW,IH)
- core image sizes : CIS = (CIW,CIH)
- image border sizes : IBS = (IBW,IBH)
- neighbourhood sizes : NS = (NW,NH)
- neighbourhood border sizes : NBS = (NBW,NBH)

3.8.4 Image functors

In general, a functor is a function wrapped in an object. An image functor refers to an object that is used to make the user-specified functional part of a pattern (see **Image processing patterns and variations** (p. 24)) do what the user wants it to do.

Image functors are addressed via **Image functor keys** (p. 23). Keys are created in the constructor of the image functors at the "real functor" level. The various parts of the key are derived from the actual template parameters via **HxClassName** (p. 495).

Image functors are collected in the **HxImgFtorTable** (p. 856). **HxImgFtorTable** (p. 856) contains a map of <**HxImgFtorKey** (p. 799), **HxImgFunctor** (p. 862)*>. In general, functors are inserted in the table via declaration of a static variable that instantiates a leaf node image functor from the tree below for a specific image type. More accurately, the constructor of **HxImgFunctor** (p. 862) (the base class of the image functor hierarchy) inserts itself in the table under its key, i.e. it inserts the <key,object> combination in the table. The insert function puts a stringified version of the <key,functor> combination in the **HxRegistry** (p. 1088) under ["/imagefunctortable/entries"].

When the user calls an image processing fuction, the **HxImageData** (p. 581) member functions construct a key by converting their arguments to strings and use this key to retrieve the right image functor from the table. The **HxImageData** (p. 581) member functions use the template class **HxImgFtorTableTem** (p. 858) to get statically typed access at the level of "I-nary" functors (see below) in the image functor hierarchy. The downcast is "safe" because the key used to find the "real functor" is derived from the key corresponding to the "I-nary" functor. Naturally, this implies that the image functor and key hierarchies should be kept in close harmony.

Other classes:

HxImgFtorDescription (p. 704), **HxImgFtorRuleBase** (p. 840),

The image functor tree

The tree has four levels:

1. The root level : **HxImgFunctor** (p. 862) (for insertion and retrieval from the table).
2. The "I-nary" level : I1 stands for "taking 1 image parameter", I2 for 2 image parameters, etc.
3. The "cast" level : the highest template level for casting of polymorphic **HxImageData** (p. 581) parameters to statically typed image data pointers.
4. The "real functor" level : the leaf nodes are the actual functors that introduce additional, pattern specific template parameters.

- **HxImgFunctor** (p. 862)
  - **HxImgFtorI1** (p. 728)
    - **HxImgFtorI1Cast** (p. 731)<ImgSigT>
      - **HxImgFtorInOut** (p. 791)<ImgSigT, InOutT>
      - **HxImgFtorRgb2d** (p. 835)<ImgSigT, RgbT>
      - **HxImgFtorRgb3d** (p. 837)<ImgSigT, RgbT>

3.8.5 Image functor keys

A key consists of a list of strings corresponding to the name of an image functor and its template parameters. Concatenating the list of strings results in a string that resembles the ”real” image functor declaration, e.g. ”HxImgFtorBpo<Image2dInt8, Image2dInt32, Image2dInt32, greaterEqual>”

Construction of a key is initiated by the leaves in the tree. Strings know to the base classes are passed to the corresponding constructor. The remainder is added via **HxImgFtorKey::addArgument** (p. 801).

The image functor key tree

- **HxImgFtorI2Key** (p. 755)
  - **HxImgFtorI2CastKey** (p. 754)
    - **HxImgFtorExportExtra** (p. 708)
    - **HxImgFtorNgbKey** (p. 821)
    - **HxImgFtorRecGenConvKey** (p. 834)
    - **HxImgFtorRecGenConvK1dKey** (p. 833)
    - **HxImgFtorSetKey** (p. 855)
    - HxImgFtorTranspose2dKey
    - **HxImgFtorUpoKey** (p. 861)
- **HxImgFtorI3Key** (p. 768)
  - **HxImgFtorI3CastKey** (p. 767)
    - **HxImgFtorBpoKey** (p. 703)
    - **HxImgFtorGenConvKey** (p. 727)
    - **HxImgFtorGenConvK1dKey** (p. 726)
    - **HxImgFtorKernelNgbKey** (p. 798)
    - **HxImgFtorNgbExtraKey** (p. 820)
- **HxImgFtorI4Key** (p. 777)
  - **HxImgFtorI4CastKey** (p. 776)
    - **HxImgFtorGenConv2dSepKey** (p. 720)
    - **HxImgFtorNgbExtra2Key** (p. 819)
- **HxImgFtorIMKey** (p. 784)
  - **HxImgFtorIMCastKey** (p. 783)
    - **HxImgFtorMpoKey** (p. 809)
- **HxImgFtorIMNKey** (p. 790)
  - **HxImgFtorIMNCastKey** (p. 789)
    - **HxImgFtorMNpoKey** (p. 806)

Note that there is not a one-on-one mapping between keys and functors. Functors that differ only in the dimensionality of the algorithm typically use the same key.

3.8.6 Image functors in the registry

The Horus registry (see **Registry** (p. 72)) contains information on image functors.

Inserted and used by **HxImgFtorRuleBase** (p. 840):

```
[/]
[/imagefunctor]
[/imagefunctor/rulebase]
[/imagefunctor/rulebase/argumenttype]
[/imagefunctor/rulebase/extratype]
[/imagefunctor/rulebase/isModifying]
[/imagefunctor/rulebase/kerneltype]
[/imagefunctor/rulebase/resulttype]
```

Inserted by **HxImgFtorTable::insert** (p. 857):

```
[/imagefunctortable]
[/imagefunctortable/entries]
[/imagefunctortable/entries/HxImgFtorBpo]
[/imagefunctortable/entries/HxImgFtorExportExtra]
[/imagefunctortable/entries/HxImgFtorGenConv]
[/imagefunctortable/entries/HxImgFtorGenConvK1d]
[/imagefunctortable/entries/HxImgFtorInOut]
[/imagefunctortable/entries/HxImgFtorMpo]
[/imagefunctortable/entries/HxImgFtorNgb]
```

```
[/imagefunctortable/entries/HxImgFtorNgb2d]
[/imagefunctortable/entries/HxImgFtorRecNgb]
[/imagefunctortable/entries/HxImgFtorRgb]
[/imagefunctortable/entries/HxImgFtorSet]
[/imagefunctortable/entries/HxImgFtorSetBorder]
[/imagefunctortable/entries/HxImgFtorTranspose2d]
[/imagefunctortable/entries/HxImgFtorUpo]
```

Inserted by **HxImgFtorRgb2d::HxImgFtorRgb2d** (p. 836) and **HxImgFtorRgb3d::HxImgFtorRgb3d** (p. 838):

```
[/imagefunctortable/rgb]
```

3.8.7 Image processing patterns and variations

The ”thing” that defines a pattern is the functor. Naming conventions for functors are geared towards the image parameters involved. This sometimes introduces confusion as, for example, a binary pixel operation applied to an image and a constant value is actually implemented by the unary pixel operation pattern (because there is only one image parameter involved).

- **Unary pixel operation** (p. 26)
  - **Translation invariant unary pixel operation** (p. 26)
  - **Translation variant unary pixel operation** (p. 27)
- **Binary pixel operation** (p. 28)
  - **Translation invariant binary pixel operation** (p. 28)
  - **Translation variant binary pixel operation** (p. 29)
- **Multi operation** (p. 29)
  - **Translation invariant multi pixel operation** (p. 30)
  - **Translation variant multi pixel operation** (p. 30)
- **M output, N input pixel operation** (p. 31)
  - **Translation invariant M output, N input pixel operation** (p. 31)
  - **Translation variant M output, N input pixel operation** (p. 32)
- **In/Out pixel operation** (p. 33)
  - **Translation invariant, 1 phase pixel export operation** (p. 33)
  - **Translation variant, 1 phase pixel export operation** (p. 34)
  - **Translation invariant, 1 phase pixel import operation** (p. 34)
  - **Translation variant, 1 phase pixel import operation** (p. 35)
  - **Translation invariant, n phase pixel export operation** (p. 35)
  - **Translation variant, n phase pixel export operation** (p. 36)
  - **Translation invariant, n phase pixel import operation** (p. 36)
  - **Translation variant, n phase pixel import operation** (p. 37)

  - **Translation invariant, 1 phase export operation with an extra image** (p. 38)
  - **Translation variant, 1 phase export operation with an extra image** (p. 39)
  - **Translation invariant, N phase export operation with an extra image** (p. 39)
  - **Translation variant, N phase export operation with an extra image** (p. 40)
- Generalized convolution
  - **Generalized convolution on 2D images** (p. 41)

Not addressable via the HxImageRep interface (for internal use only):

To be re-written:

3.8.8 Unary pixel operation

The pattern loops over all pixels in the image and applies the pixel functor to each pixel. The result is written to the corresponding position in the result image.

Instantiations of the pattern are invoked via

- **HxImageRep::unaryPixOp** (p. 629)
- **HxImageRep::binaryPixOp**(const HxValue,HxString,HxTagList&) (p. 629)

Instantiation is done via the **HxImgFtorUpo** (p. 859) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- UpoT is the type of the pixel functor

The requirements for the UpoT parameter and an example of its use are given in the sections on variations:

- **Translation invariant unary pixel operation** (p. 26)
- **Translation variant unary pixel operation** (p. 27)

Tags for UpoT variations:

- TransVarianceCategory : **HxTagTransVar** (p. 1204) or **HxTagTransInVar** (p. 1204)

For further reference :

- Method frame : **HxMfUpo** (p. 1033)
- HxImageData member : **HxImageData::unaryPixOp** (p. 593)

3.8.9 Translation invariant unary pixel operation

Pseudo code of the operation:

```
UnaryPixOp(Dst, Src, Upo)
{
    foreach d, s in Dst, Src
        Dst(d) = Upo.doIt(Src(s));
}
```

The requirements on the UpoT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT>
class UpoT
{
public:
    typedef HxTagTransInVar     TransVarianceCategory;

                        UpoT(HxTagList&);

    DstValT             doIt(const SrcValT& v);

    static HxString     className();
};
```

The function doIt will be called with 1 parameter of type SrcImgSigT::ArithType, and the result will be stored in a variable of type DstImgSigT::ArithType before being written to the destination image.

Example(s):

- instantiation : **HxInstantiatorAbs_c** (p. **??**), usage : **HxAbs** (p. 75)
- instantiation : **HxInstantiatorAddV_c** (p. **??**), usage : **HxAddVal** (p. 82)

3.8.10 Translation variant unary pixel operation

Pseudo code of the operation:

```
UnaryPixOp(Dst, Src, Upo)
{
    foreach d, s in Dst, Src
        Dst(d) = Upo.doIt(Src(s), s.x, s.y, s.z);
}
```

The requirements on the UpoT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT>
class UpoT
{
public:
    typedef HxTagTransVar       TransVarianceCategory;

                        UpoT(HxTagList&);

    DstValT             doIt(const SrcValT& v, int x, int y, int z);

    static HxString     className();
};
```

The function doIt will be called with 1 parameter of type SrcImgSigT::ArithType, and the result will be stored in a variable of type DstImgSigT::ArithType before being written to the destination image.

3.8.11 Binary pixel operation

The pattern loops over all pixels in the input images and applies the pixel functor to each pair of pixels. The result is written to the corresponding position in the result image.

Instantiations of the pattern are invoked via

- **HxImageRep::binaryPixOp**(const HxImageRep,HxString,HxTagList&) (p. 630)

Instantiation is done via the **HxImgFtorBpo** (p. 700) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- Src1ImgSigT is the signature type of the first source image
- Src2ImgSigT is the signature type of the second source image
- BpoT is the type of the pixel functor

The requirements for the BpoT parameter and an example of its use are given in the sections on variations:

- **Translation invariant binary pixel operation** (p. 28)

- **Translation variant binary pixel operation** (p. 29)

Tags for BpoT variations:

- TransVarianceCategory : **HxTagTransVar** (p. 1204) or **HxTagTransInVar** (p. 1204)

For further reference :

- Method frame : **HxMfBpo** (p. 1006)
- HxImageData member : **HxImageData::binaryPixOp** (p. 593)

3.8.12 Translation invariant binary pixel operation

Pseudo code of the operation:

```
BinaryPixOp(Dst, Src1, Src2, Bpo)
{
    foreach d, s1, s2 in Dst, Src1, Src2
        Dst(d) = Bpo.doIt(Src1(s1), Src2(s2));
}
```

The requirements on the BpoT template parameter expressed as class definition are:

```
template<class DstValT, class Src1ValT, class Src2ValT>
class BpoT
{
public:
    typedef HxTagTransInVar     TransVarianceCategory;

                        BpoT(HxTagList&);

    DstValT             doIt(const Src1ValT& v1, const Src2ValT& v2);

    static HxString     className();
};
```

The function doIt will be called with 2 parameters of type Src1ImgSigT::ArithType and Src2ImgSigT::ArithType, and the result will be stored in a variable of type DstImgSigT::ArithType before being written to the destination image.

Example(s):

- instantiation : **HxInstantiatorAdd_c** (p. **??**), usage : **HxAdd** (p. 77)

3.8.13 Translation variant binary pixel operation

Pseudo code of the operation:

```
BinaryPixOp(Dst, Src1, Src2, Bpo)
{
    foreach d, s1, s2 in Dst, Src1, Src2
        Dst(d) = Bpo.doIt(Src1(s1), Src2(s2), s1.x, s1.y, s1.z);
}
```

The requirements on the BpoT template parameter expressed as class definition are:

```
template<class DstValT, class Src1ValT, class Src2ValT>
class BpoT
{
public:
    typedef HxTagTransVar       TransVarianceCategory;

                        BpoT(HxTagList&);

    DstValT             doIt(const Src1ValT& v1, const Src2ValT& v2,
                             int x, int y, int z);

    static HxString     className();
};
```

The function doIt will be called with 2 parameters of type Src1ImgSigT::ArithType and Src2ImgSigT::ArithType, and the result will be stored in a variable of type DstImgSigT::ArithType before being written to the destination image.

3.8.14 Multi operation

The pattern loops over all pixels in the input images and applies the pixel functor to each set of pixels. The result is written to the corresponding position in the result image.

Instantiations of the pattern are invoked via

- **HxImageRep::multiPixOp** (p. 630)

Instantiation is done via the **HxImgFtorMpo** (p. 807) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgsSigT is the signature type of the source images
- MpoT is the type of the multi pixel functor

The requirements for the MpoT parameter and an example of its use are given in the sections on variations:

- **Translation invariant multi pixel operation** (p. 30)
- **Translation variant multi pixel operation** (p. 30)

Tags for MpoT variations:

- TransVarianceCategory : **HxTagTransVar** (p. 1204) or **HxTagTransInVar** (p. 1204)

For further reference :

- Method frame : **HxMfMpo** (p. 1024)
- HxImageData member : **HxImageData::multiPixOp** (p. 594)

3.8.15 Translation invariant multi pixel operation

Pseudo code of the operation:

```
MultiPixOp(Dst, Src[], Mpo)
{
    foreach d, s, in Dst, Src[]
        Dst(d) = Mpo.doIt(Src[0](s) ... Src[N](s));
}
```

The requirements on the MpoT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT>
class MpoT
{
public:
    typedef HxTagTransInVar     TransVarianceCategory;

                    MpoT(HxTagList& tags);

    DstValT         doIt(SrcValT const *v);

    static HxString className();
};
```

The function doIt will be called with an array containing the pixels of the source images. On construction, the number of sources can be retrieved from the tag list by tag ”sourceCnt”. The result will be stored in a variable of type DstImgSigT::ArithType before being written to the destination image.

3.8.16 Translation variant multi pixel operation

Pseudo code of the operation:

```
MultiPixOp(Dst, Src[], Mpo)
{
    foreach d, s, in Dst, Src[]
        Dst(d) = Mpo.doIt(Src[0](s) ... Src[N](s), s.x, s.y, s.z);
}
```

The requirements on the MpoT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT>
class MpoT
{
public:
    typedef HxTagTransVar       TransVarianceCategory;

                    MpoT(HxTagList& tags);

    DstValT         doIt(SrcValT const *v, int x, int y, int z);

    static HxString className();
};
```

The function doIt will be called with an array containing the pixels of the source images. On construction, the number of sources can be retrieved from the tag list by tag ”sourceCnt”. The result will be stored in a variable of type DstImgSigT::ArithType before being written to the destination image.

3.8.17 M output, N input pixel operation

The pattern loops over all pixels in the N input images and applies the pixel functor to each pair of N pixels. The result set of M values is written to the corresponding positions in the M result image.

Instantiations of the pattern are invoked via

- **HxImageRep::MNPixOp** (p. 631)

Instantiation is done via the **HxImgFtorMNpo** (p. 804) functor, with the following template parameters:

- DstImgsSigT is the signature type of the destination images
- SrcImgsSigT is the signature type of the source images
- MNpoT is the type of the multi pixel functor

The requirements for the MNpoT parameter and an example of its use are given in the sections on variations:

- **Translation invariant M output, N input pixel operation** (p. 31)
- **Translation variant M output, N input pixel operation** (p. 32)

Tags for MNpoT variations:

- TransVarianceCategory : **HxTagTransVar** (p. 1204) or **HxTagTransInVar** (p. 1204)

For further reference :

- Method frame : **HxMfMNpo** (p. 1020)
- HxImageData member : **HxImageData::MNPixOp** (p. 594)

3.8.18 Translation invariant M output, N input pixel operation

Pseudo code of the operation:

```
MNPixOp(Dst[], Src[], MNpo)
{
    foreach d, s, in Dst[], Src[]
        Dst[0](d) ... Dst[M](d) = MNpo.doIt(Src[0](s), ..., Src[N](s));
}
```

The requirements on the MNpoT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT>
class MNpoT
{
public:
    typedef HxTagTransInVar     TransVarianceCategory;

                    MNpoT(HxTagList& tags);

    void            doIt(DstValT *d, SrcValT const *s);

    static HxString className();
};
```

The function doIt will be called with 2 arrays, destination pixels and source pixels. On construction, the number of sources can be retrieved from the tag list by tag ”sourceCnt”. The constructor should return the required number of destination images by the tag ”resultCnt”. The results should be stored in the y-array before being written to the destination images. If the operation is not applicable for the given number of source images, the constructor may indicate failure in the pre-conditioning by returning ”preOpIsOk” false in the tag list.

3.8.19 Translation variant M output, N input pixel operation

Pseudo code of the operation:

```
MNPixOp(Dst[], Src[], MNpo)
{
    foreach d, s, in Dst[], Src[]
        Dst[0](d) ... Dst[M](d) = MNpo.doIt(Src[0](s), ..., Src[N](s),
                                            i.x, i.y, i.z);
}
```

The requirements on the MNpoT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT>
class MNpoT
{
public:
    typedef HxTagTransVar       TransVarianceCategory;

                    MNpoT(HxTagList& tags);

    void            doIt(DstValT *d, SrcValT const *s, int x, int y, int z);

    static HxString className();
};
```

The function doIt will be called with 2 arrays, destination pixels and source pixels. On construction, the number of sources can be retrieved from the tag list by tag ”sourceCnt”. The constructor should return the required number of destination images by the tag ”resultCnt”. The results should be stored in the y-array before being written to the destination images. If the operation is not applicable for the given number of source images, the constructor may indicate failure in the pre-conditioning by returning ”preOpIsOk” false in the tag list.

3.8.20 In/Out pixel operation

The pattern loops (a number of times) over all pixels in the image and fetches/offers each pixel from/to a pixel functor. With the In variation of the pattern the pixel functor is asked to produce a pixel value for each position in the image. With the Out variation of the pattern the pixel functor is offered the pixel value at each position to do something with it.

Instantiations of the pattern are invoked via

- ”constructors/factory”
- **HxImageRep::exportOp** (p. 631)

Instantiation is done via the **HxImgFtorInOut** (p. 791) functor, with the following template parameters:

- ImgSigT is the signature type of the image
- InOutT is the type of the in/out pixel functor

The requirements for the InOutT parameter and an example of its use are given in the sections on variations:

- **Translation invariant, 1 phase pixel export operation** (p. 33)
- **Translation variant, 1 phase pixel export operation** (p. 34)
- **Translation invariant, 1 phase pixel import operation** (p. 34)

- **Translation variant, 1 phase pixel import operation** (p. 35)
- **Translation invariant, n phase pixel export operation** (p. 35)
- **Translation variant, n phase pixel export operation** (p. 36)
- **Translation invariant, n phase pixel import operation** (p. 36)
- **Translation variant, n phase pixel import operation** (p. 37)

Tags for InOutT variations:

- DirectionCategory : **HxTagPixOpIn** (p. 1201) or **HxTagPixOpOut** (p. 1201)
- TransVarianceCategory : **HxTagTransVar** (p. 1204) or **HxTagTransInVar** (p. 1204)
- PhaseCategory : **HxTag1Phase** (p. 1194) or **HxTagNPhase** (p. 1200)

For further reference :

- Method frame : <none>
- HxImageData member : **HxImageData::inout** (p. 591)

3.8.21 Translation invariant, 1 phase pixel export operation

Pseudo code of the operation:

```
OutPixOp(In, PixOp)
{
    foreach i in In
        PixOp.doIt(In(i));
}
```

The requirements on the PixOpT template parameter expressed as class definition are:

```
template<class ArithT>
class PixOpT
{
public:
    typedef HxTagPixOpOut   DirectionCategory;
    typedef HxTagTransInVar TransVarianceCategory;
    typedef HxTag1Phase     PhaseCategory;

                        PixOpT(HxTagList&);

    void                doIt(const ArithT& v);

    static HxString     className();
};
```

3.8.22 Translation variant, 1 phase pixel export operation

Pseudo code of the operation:

```
OutPixOp(In, PixOp)
{
    foreach i in In
        PixOp.doIt(In(i), i.x, i.y, i.z);
}
```

The requirements on the PixOpT template parameter expressed as class definition are:

```
template<class ArithT>
class PixOpT
{
public:
    typedef HxTagPixOpOut   DirectionCategory;
    typedef HxTagTransVar   TransVarianceCategory;
    typedef HxTag1Phase     PhaseCategory;

                        PixOpT(HxTagList&, int w, int h, int d);

    void                doIt(const ArithT& v, int x, int y, int z);

    static HxString     className();
};
```

3.8.23 Translation invariant, 1 phase pixel import operation

Pseudo code of the operation:

```
InPixOp(Out, PixOp)
{
    foreach o in Out
        Out(o) = PixOp.doIt();
}
```

The requirements on the PixOpT template parameter expressed as class definition are:

```
template<class ArithT>
class PixOpT
{
public:
    typedef HxTagPixOpIn    DirectionCategory;
    typedef HxTagTransInVar TransVarianceCategory;
    typedef HxTag1Phase     PhaseCategory;

                        PixOpT(HxTagList&);

    ArithT              doIt();

    static HxString     className();
};
```

3.8.24 Translation variant, 1 phase pixel import operation

Pseudo code of the operation:

```
InPixOp(Out, PixOp)
{
    foreach o in Out
        Out(o) = PixOp.doIt(o.x, o.y, o.z);
}
```

The requirements on the PixOpT template parameter expressed as class definition are:

```
template<class ArithT>
```

```
class PixOpT
{
public:
    typedef HxTagPixOpIn    DirectionCategory;
    typedef HxTagTransVar   TransVarianceCategory;
    typedef HxTag1Phase     PhaseCategory;

                        PixOpT(HxTagList&, int w, int h, int d);

    ArithT              doIt(int x, int y, int z);

    static HxString     className();
};
```

3.8.25 Translation invariant, n phase pixel export operation

Pseudo code of the operation:

```
OutPixOp(In, PixOp)
{
    for p = 1 to PixOp.nrPhases();
    {
        PixOp.init(p)
        foreach i in In
            PixOp.doIt(In(i));
        PixOp.done(p)
    }
}
```

The requirements on the PixOpT template parameter expressed as class definition are:

```
template<class ArithT>
class PixOpT
{
public:
    typedef HxTagPixOpOut   DirectionCategory;
    typedef HxTagTransInVar TransVarianceCategory;
    typedef HxTagNPhase     PhaseCategory;

                        PixOpT(HxTagList&);

    void                doIt(const ArithT& v);

    int                 nrPhases() const;
    void                init(int phase);
    void                done(int phase);

    static HxString     className();
};
```

3.8.26 Translation variant, n phase pixel export operation

Pseudo code of the operation:

```
OutPixOp(In, PixOp)
{
    for p = 1 to PixOp.nrPhases();
    {
        PixOp.init(p)
```

```
        foreach i in In
            PixOp.doIt(In(i), i.x, i.y, i.z);
        PixOp.done(p)
    }
}
```

The requirements on the PixOpT template parameter expressed as class definition are:

```
template<class ArithT>
class PixOpT
{
public:
    typedef HxTagPixOpOut   DirectionCategory;
    typedef HxTagTransVar   TransVarianceCategory;
    typedef HxTagNPhase     PhaseCategory;

                        PixOpT(HxTagList&, int w, int h, int d);

    void                doIt(const ArithT& v, int x, int y, int z);

    int                 nrPhases() const;
    void                init(int phase);
    void                done(int phase);

    static HxString     className();
};
```

3.8.27 Translation invariant, n phase pixel import operation

Pseudo code of the operation:

```
InPixOp(Out, PixOp)
{
    for p = 1 to PixOp.nrPhases();
    {
        PixOp.init(p)
        foreach o in Out
            Out(o) = PixOp.doIt();
        PixOp.done(p)
    }
}
```

The requirements on the PixOpT template parameter expressed as class definition are:

```
template<class ArithT>
class PixOpT
{
public:
    typedef HxTagPixOpIn    DirectionCategory;
    typedef HxTagTransInVar TransVarianceCategory;
    typedef HxTagNPhase     PhaseCategory;

                        PixOpT(HxTagList&);

    ArithT              doIt();

    int                 nrPhases() const;
    void                init(int phase);
    void                done(int phase);

    static HxString     className();
};
```

3.8.28 Translation variant, n phase pixel import operation

Pseudo code of the operation:

```
InPixOp(Out, PixOp)
{
    for p = 1 to PixOp.nrPhases();
    {
        PixOp.init(p)
        foreach o in Out
            Out(o) = PixOp.doIt(o.x, o.y, o.z);
        PixOp.done(p)
    }
}
```

The requirements on the PixOpT template parameter expressed as class definition are:

```
template<class ArithT>
class PixOpT
{
public:
    typedef HxTagPixOpIn    DirectionCategory;
    typedef HxTagTransVar   TransVarianceCategory;
    typedef HxTagNPhase     PhaseCategory;

                        PixOpT(HxTagList&, int w, int h, int d);

    ArithT              doIt(int x, int y, int z);

    int                 nrPhases() const;
    void                init(int phase);
    void                done(int phase);

    static HxString     className();
};
```

3.8.29 Export operation with an extra image

The pattern loops over all pixels in the image and an extra image and offers the pixels to a pixel functor.

Instantiations of the pattern are invoked via

- **HxImageRep::exportOpExtra** (p. 632)

Instantiation is done via the **HxImgFtorExportExtra** (p. 708) functor, with the following template parameters:

- ImgSigT is the signature type of the image
- ExtraImgSigT is the signature type of the extra image
- ExportExtraT is the type of the export pixel functor

The requirements for the ExportExtraT parameter and an example of its use are given in the sections on variations:

- **Translation invariant, 1 phase export operation with an extra image** (p. 38)
- **Translation variant, 1 phase export operation with an extra image** (p. 39)
- **Translation invariant, N phase export operation with an extra image** (p. 39)

- **Translation variant, N phase export operation with an extra image** (p. 40)

Tags for ExportExtraT variations:

- TransVarianceCategory : **HxTagTransVar** (p. 1204) or **HxTagTransInVar** (p. 1204)
- PhaseCategory : **HxTag1Phase** (p. 1194) or **HxTagNPhase** (p. 1200)

For further reference :

- Method frame : **HxMfExportExtra** (p. 1011)
- HxImageData member : **HxImageData::exportExtra** (p. 592)

3.8.30 Translation invariant, 1 phase export operation with an extra image

Pseudo code of the operation:

```
ExportOpExtra(In, Extra, ExportOp)
{
    foreach i, e in In, Extra
        ExportOp.doIt(In(i), Extra(e));
}
```

The requirements on the ExportExtraT template parameter expressed as class definition are:

```
template<class ImValT, class ExtraValT>
class ExportExtraT
{
public:
    typedef HxTagTransInVar     TransVarianceCategory;
    typedef HxTag1Phase         PhaseCategory;

                        ExportExtraT(HxTagList&);

    void                doIt(const ImValT& imV, const ExtraValT& extraV);

    static HxString     className();
};
```

Example(s):

- instantiation : **HxInstExportExtraIdentMaskMean_c** (p. **??**), usage : **HxIdentMaskMean** (p. 239)

3.8.31 Translation variant, 1 phase export operation with an extra image

Pseudo code of the operation:

```
ExportOpExtra(In, Extra, ExportOp)
{
    foreach i, e in In, Extra
        ExportOp.doIt(In(i), Extra(e), i.x, i.y, i.z);
}
```

The requirements on the ExportExtraT template parameter expressed as class definition are:

```
template<class ImValT, class ExtraValT>
class ExportExtraT
{
public:
    typedef HxTagTransVar       TransVarianceCategory;
    typedef HxTag1Phase         PhaseCategory;

                        ExportExtraT(HxTagList&);

    void                doIt(const ImValT& imV, const ExtraValT& extraV,
                             int x, int y, int z);

    static HxString     className();
};
```

Example(s):

- instantiation : **HxInstExportExtraIdentMaskMoments_c** (p. **??**), usage : **HxIdentMaskMoments** (p. 241)

3.8.32 Translation invariant, N phase export operation with an extra image

Pseudo code of the operation:

```
ExportOpExtra(In, Extra, ExportOp)
{
    for p = 1 to ExportOp.nrPhases();
    {
        ExportOp.init(p);
        foreach i, e in In, Extra
            ExportOp.doIt(In(i), Extra(e));
        ExportOp.done(p);
    }
}
```

The requirements on the ExportExtraT template parameter expressed as class definition are:

```
template<class ImValT, class ExtraValT>
class ExportExtraT
{
public:
    typedef HxTagTransInVar     TransVarianceCategory;
    typedef HxTagNPhase         PhaseCategory;

                        ExportExtraT(HxTagList&);

    int                 nrPhases() const;
    void                init(int phase);
    void                doIt(const ImValT& imV, const ExtraValT& extraV);
    void                done(int phase);

    static HxString     className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.33 Translation variant, N phase export operation with an extra image

Pseudo code of the operation:

```
ExportOpExtra(In, Extra, ExportOp)
{
    for p = 1 to ExportOp.nrPhases();
    {
        ExportOp.init(p);
        foreach i, e in In, Extra
            ExportOp.doIt(In(i), Extra(e), i.x, i.y, i.z);
        ExportOp.done(p);
    }
}
```

The requirements on the ExportExtraT template parameter expressed as class definition are:

```
template<class ImValT, class ExtraValT>
class ExportExtraT
{
public:
    typedef HxTagTransVar       TransVarianceCategory;
    typedef HxTagNPhase         PhaseCategory;

                        ExportExtraT(HxTagList&);

    int                 nrPhases() const;
    void                init(int phase);
    void                doIt(const ImValT& imV, const ExtraValT& extraV,
                             int x, int y, int z);
    void                done(int phase);

    static HxString     className();
};
```

Example(s):

- instantiation : **HxInstExportExtraIdentMaskCentralMoments.c** (p. **??**), usage : **HxIdentMaskCentralMoments** (p. 238)

3.8.34 Generalized convolution on 2D images

The pattern loops over all pixels in the image and performs a generalized convolution in the neighbourhood of each pixel. The result is written to the corresponding position in the result image.

A generalized convolution is like a convolution but the multiplication and addition steps are replaced with functors. The functors are called gMul (for generalized multiplication) and gAdd (for generalized addition). Using multiplication and addition as parameters in a generalized convolution thus turns it into a ”normal” convolution. However, the are other possibilities. For example, using addition and minimum results in an erosion.

Instantiations of the pattern are invoked via

- **HxImageRep::generalizedConvolution** (p. 632)

Instantiation is done via the **HxImgFtorGenConv2d** (p. 711) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- KerImgSigT is the signature type of the kernel image
- PixOpT is the type of the pixel combining functor
- RedOpT is the type of the pixel reducing functor
- KernelT is the type of the kernel functor

Example(s):

- instantiation : **HxInstGenConv2dMulAdd_c** (p. **??**), usage : **HxUniformNonSep** (p. 378)

For further reference :

- Method frame : **HxMfGenConv** (p. 1013)
- HxImageData member : **HxImageData::generalizedConvolution** (p. 594)

3.8.35 Generalized convolution on 2D images, separated by dimension

The pattern loops over all pixels in the image and performs a generalized convolution in the neighbourhood of each pixel, processing each dimension independent of the others. The result is written to the corresponding position in the result image.

A generalized convolution is like a convolution but the multiplication and addition steps are replaced with functors. The functors are called gMul (for generalized multiplication) and gAdd (for generalized addition). Using multiplication and addition as parameters in a generalized convolution thus turns it into a ”normal” convolution. However, the are other possibilities. For example, using addition and minimum results in an erosion.

Instantiations of the pattern are invoked via

- **HxImageRep::genConvSeparated** (p. 633)
- **HxImageRep::genConv2dSep** (p. 634)

Instantiation is done via the **HxImgFtorGenConv2dSep** (p. 717) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- KerImgSigT is the signature type of the kernel image
- PixOpT is the type of the pixel combining functor
- RedOpT is the type of the pixel reducing functor
- KernelT is the type of the kernel functor

Example(s):

- instantiation : **HxInstGenConv2dSepMulAdd_c** (p. **??**), usage : **HxCannyEdgeMap** (p. 94)

For further reference :

- Method frame : **HxMfGenConv** (p. 1013)
- HxImageData member : **HxImageData::genConv2dSep** (p. 597)

3.8.36 Generalized convolution on 2D images, with a 1D kernel

The pattern loops over all pixels in the image and performs a generalized convolution in the neighbourhood of each pixel, processing each dimension independent of the others. The result is written to the corresponding position in the result image.

A generalized convolution is like a convolution but the multiplication and addition steps are replaced with functors. The functors are called gMul (for generalized multiplication) and gAdd (for generalized addition). Using multiplication and addition as parameters in a generalized convolution thus turns it into a ”normal” convolution. However, the are other possibilities. For example, using addition and minimum results in an erosion.

Instantiations of the pattern are invoked via

- **HxImageRep::generalizedConvolutionK1d** (p. 633)
- **HxImageRep::genConvSeparated** (p. 633)
- **HxImageRep::genConv3dSep** (p. 634)

Instantiation is done via the **HxImgFtorGenConv2dK1d** (p. 714) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- KerImgSigT is the signature type of the kernel image
- PixOpT is the type of the pixel combining functor
- RedOpT is the type of the pixel reducing functor
- KernelT is the type of the kernel functor

Example(s):

- instantiation : **HxInstGenConv2dK1dMulAdd_c** (p. **??**), usage : **HxRecGauss** (p. 330)

For further reference :

- Method frame : **HxMfGenConv** (p. 1013)
- HxImageData member : **HxImageData::generalizedConvolutionK1d** (p. 595)
- HxImageData member : **HxImageData::genConvSeparated** (p. 596)

3.8.37 Generalized convolution on 3D images

The pattern loops over all pixels in the image and performs a generalized convolution in the neighbourhood of each pixel. The result is written to the corresponding position in the result image.

A generalized convolution is like a convolution but the multiplication and addition steps are replaced with functors. The functors are called gMul (for generalized multiplication) and gAdd (for generalized addition). Using multiplication and addition as parameters in a generalized convolution thus turns it into a ”normal” convolution. However, the are other possibilities. For example, using addition and minimum results in an erosion.

Instantiations of the pattern are invoked via

- **HxImageRep::generalizedConvolution** (p. 632)

Instantiation is done via the **HxImgFtorGenConv3d** (p. 721) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- KerImgSigT is the signature type of the kernel image
- PixOpT is the type of the pixel combining functor
- RedOpT is the type of the pixel reducing functor
- KernelT is the type of the kernel functor

Example(s):

- instantiation : **HxInstGenConv3dMulAdd_c** (p. **??**), usage : **HxUniformNonSep** (p. 378)

For further reference :

- Method frame : **HxMfGenConv** (p. 1013)
- HxImageData member : **HxImageData::generalizedConvolution** (p. 594)

3.8.38 Generalized convolution on 3D images, with a 1D kernel

The pattern loops over all pixels in the image and performs a generalized convolution in the neighbourhood of each pixel, processing each dimension independent of the others. The result is written to the corresponding position in the result image.

A generalized convolution is like a convolution but the multiplication and addition steps are replaced with functors. The functors are called gMul (for generalized multiplication) and gAdd (for generalized addition). Using multiplication and addition as parameters in a generalized convolution thus turns it into a ”normal” convolution. However, the are other possibilities. For example, using addition and minimum results in an erosion.

Instantiations of the pattern are invoked via

- **HxImageRep::generalizedConvolutionK1d** (p. 633)
- **HxImageRep::genConvSeparated** (p. 633)
- **HxImageRep::genConv3dSep** (p. 634)

Instantiation is done via the **HxImgFtorGenConv3dK1d** (p. 723) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- KerImgSigT is the signature type of the kernel image
- PixOpT is the type of the pixel combining functor
- RedOpT is the type of the pixel reducing functor
- KernelT is the type of the kernel functor

Example(s):

- instantiation : **HxInstGenConv3dK1dMulAdd_c** (p. **??**), usage : **HxUniform** (p. 377)

For further reference :

- Method frame : **HxMfGenConv** (p. 1013)
- HxImageData member : **HxImageData::generalizedConvolutionK1d** (p. 595)
- HxImageData member : **HxImageData::genConv3dSep** (p. 598)

3.8.39 Recursive generalized convolution on 2D images

The pattern loops over all pixels in the image and performs a recursive generalized convolution in the neighbourhood of each pixel. The result is written to the corresponding position in the same image.

A generalized convolution is like a convolution but the multiplication and addition steps are replaced with functors. The functors are called gMul (for generalized multiplication) and gAdd (for generalized addition).

Instantiations of the pattern are invoked via

- **HxImageRep::recGenConv** (p. 635)

Instantiation is done via the **HxImgFtorRecGenConv2d** (p. 828) functor, with the following template parameters:

- ImgSigT is the signature type of the source/destination image
- KerImgSigT is the signature type of the kernel image
- PixOpT is the type of the pixel combining functor
- RedOpT is the type of the pixel reducing functor

Example(s):

- instantiation : **HxInstRecGenConv2dAddMin_c** (p. **??**), usage : **HxDistanceTransform** (p. 125)

For further reference :

- Method frame : **HxMfGenConv** (p. 1013)
- HxImageData member : **HxImageData::recGenConv** (p. 599)

3.8.40 Recursive generalized convolution on 2D images, with a 1D kernel

The pattern loops over all pixels in the image and performs a recursive generalized convolution in the neighbourhood of each pixel, processing each dimension independent of the others. The result is written to the corresponding position in the same image.

A generalized convolution is like a convolution but the multiplication and addition steps are replaced with functors. The functors are called gMul (for generalized multiplication) and gAdd (for generalized addition).

Instantiations of the pattern are invoked via

- **HxImageRep::recGenConv2dSep** (p. 635)

Instantiation is done via the **HxImgFtorRecGenConv2dK1d** (p. 830) functor, with the following template parameters:

- ImgSigT is the signature type of the source/destination image
- KerImgSigT is the signature type of the kernel image
- PixOpT is the type of the pixel combining functor
- RedOpT is the type of the pixel reducing functor

Example(s):

- instantiation : **HxInstRecGenConv2dK1dMulAdd_c** (p. **??**), usage : **HxRecGauss** (p. 330)

For further reference :

- Method frame : **HxMfGenConv** (p. 1013)
- HxImageData member : **HxImageData::recGenConv2dSep** (p. 600)

3.8.41 Neighbourhood operation on 2D images

The pattern loops over all pixels in the image and applies the neighbourhood functor to each pixel. The result is written to the corresponding position in the result image.

Instantiations of the pattern are invoked via

- **HxImageRep::neighbourhoodOp**(HxString,HxTagList&) (p. 636)

Instantiation is done via the **HxImgFtorNgb2d** (p. 810) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- NgbT is the type of the neighbourhood functor

The requirements for the NgbT parameter and an example of its use are given in the sections on variations:

- **1 phase, coordinate enumerated neighbourhood operation** (p. 46)
- **1 phase, loop neighbourhood operation** (p. 47)
- **2 phase, loop neighbourhood operation** (p. 48)
- **N phase, loop neighbourhood operation** (p. 49)

Tags for NgbT variations:

- PhaseCategory : **HxTag1Phase** (p. 1194) or **HxTag2Phase** (p. 1195) or **HxTagNPhase** (p. 1200)
- IteratorCategory : **HxTagCnum** (p. 1195) or **HxTagLoop** (p. 1199)

For further reference :

- Method frame : **HxMfNgb** (p. 1026)
- HxImageData member : **HxImageData::neighbourhoodOp**(HxImageData∗,HxString,HxTagList&) (p. 601)

3.8.42 1 phase, coordinate enumerated neighbourhood operation

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ngb)
{
    foreach d, s in Dst, Src {
        Ngb.init(s.x, s.y, Src(s));
        foreach n in Ngb.begin() .. Ngb.end()
            Ngb.next(n.x, n.y, Src(s + n));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT>
class NgbT
{
public:

    typedef HxTagCnum       IteratorCategory;
    typedef HxTag1Phase     PhaseCategory;

    typedef HxCnum              CnumType;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    CnumType                    begin();
    CnumType                    end();

    void                        init(int ix, int iy, SrcValT value);
    void                        next(int nx, int ny, SrcValT value);
    DstValT                     result() const;

    static HxString             className();
};
```

The Requirements on CnumType expressed as a class definition are:

```
class CnumType
{
public:
                                CnumType();
                                CnumType(const CnumType& rhs);
    CnumType&                   operator=(const CnumType& rhs);
    int                         x();
    int                         y();
    int                         z();
    void                        inc();
    bool                        operator!=(const CnumType& rhs);
};
```

Example(s):

- instantiation : **HxInstNgbNonMaxSuppression2d_c** (p. **??**), usage : **HxNonMaxSuppressionGradDir** (p. 305)
- instantiation : **HxInstNgbIsMaxGradDir2d_c** (p. **??**), usage : **HxCannyThresholdAlt** (p. 96)

3.8.43 1 phase, loop neighbourhood operation

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ngb)
{
    foreach d, s in Dst, Src {
        Ngb.init(s.x, s.y, Src(s));
        foreach n in Ngb.size()
            Ngb.next(n.x, n.y, Src(s - (Ngb.size()/2) + n));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTag1Phase     PhaseCategory;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    void                        init(int ix, int iy, SrcValT value);
    void                        next(int nx, int ny, SrcValT value);
    DstValT                     result() const;

    static HxString             className();
};
```

Example(s):

- instantiation : **HxInstNgbPercentile2d_c** (p. **??**), usage : **HxPercentile** (p. 320)

3.8.44 2 phase, loop neighbourhood operation

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ngb)
{
    foreach d, s in Dst, Src {
        Ngb.init(s.x, s.y, Src(s));
        foreach n in Ngb.size()
            Ngb.next(n.x, n.y, Src(s - (Ngb.size()/2) + n));
        Ngb.init2(s.x, s.y, Src(s));
        foreach n in Ngb.size()
            Ngb.next2(n.x, n.y, Src(s - (Ngb.size()/2) + n));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTag2Phase     PhaseCategory;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    void                        init(int ix, int iy, SrcValT value);
```

```
    void                        next(int nx, int ny, SrcValT value);

    void                        init2(int ix, int iy, SrcValT value);
    void                        next2(int nx, int ny, SrcValT value);

    DstValT                     result() const;

    static HxString             className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.45 N phase, loop neighbourhood operation

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ngb)
{
    foreach d, s in Dst, Src {
        phase = 1;
        do {
            Ngb.init(phase, s.x, s.y, Src(s));
            foreach n in Ngb.size()
                Ngb.next(n.x, n.y, Src(s - (Ngb.size()/2) + n));
            Ngb.done(phase);
        } while (Ngb.hasNextPhase(phase++));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTagNPhase     PhaseCategory;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    void                        init(int phase, int ix, int iy, SrcValT value);
    void                        next(int nx, int ny, SrcValT value);
    void                        done(int phase);
    bool                        hasNextPhase(int thisPhase);
    DstValT                     result() const;

    static HxString             className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.46 Neighbourhood operation on 2D images with an extra image

The pattern loops over all pixels in the image and the extra image and applies the neighbourhood functor to the pixels. The result is written to the corresponding position in the result image.

Instantiations of the pattern are invoked via

- **HxImageRep::neighbourhoodOpExtra**(HxString,HxImageRep,HxTagList&) (p. 636)

Instantiation is done via the **HxImgFtorNgb2dExtra** (p. 813) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- ExtraImgSigT is the signature type of the extra image
- NgbT is the type of the neighbourhood functor

The requirements for the NgbT parameter and an example of its use are given in the sections on variations:

- **1 phase, coordinate enumerated neighbourhood operation with an extra image** (p. 50)
- **1 phase, loop neighbourhood operation with an extra image** (p. 51)
- **2 phase, loop neighbourhood operation with an extra image** (p. 52)
- **N phase, loop neighbourhood operation with an extra image** (p. 53)

Tags for NgbT variations:

- PhaseCategory : **HxTag1Phase** (p. 1194) or **HxTag2Phase** (p. 1195) or **HxTagNPhase** (p. 1200)
- IteratorCategory : **HxTagCnum** (p. 1195) or **HxTagLoop** (p. 1199)

For further reference :

- Method frame : **HxMfNgb** (p. 1026)
- HxImageData member : **HxImageData::neighbourhoodOpExtra**(HxImageData∗,HxImageData∗,HxString,HxTagList&) (p. 601)

3.8.47 1 phase, coordinate enumerated neighbourhood operation with an extra image

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ext, Ngb)
{
    foreach d, s, e in Dst, Src, Ext {
        Ngb.init(s.x, s.y, Src(s), Ext(e));
        foreach n in Ngb.begin() .. Ngb.end()
            Ngb.next(n.x, n.y, Src(s + n), Ext(e + n));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class ExtValT>
class NgbT
{
public:

    typedef HxTagCnum       IteratorCategory;
    typedef HxTag1Phase     PhaseCategory;

    typedef HxCnum              CnumType;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    CnumType                    begin();
    CnumType                    end();

    void                        init(int ix, int iy, SrcValT v1, ExtValT v2);
    void                        next(int nx, int ny, SrcValT v1, ExtValT v2);
    DstValT                     result() const;

    static HxString             className();
};
```

The Requirements on CnumType expressed as a class definition are:

```
class CnumType
{
public:
                                CnumType();
                                CnumType(const CnumType& rhs);
    CnumType&                   operator=(const CnumType& rhs);
    int                         x();
    int                         y();
    int                         z();
    void                        inc();
    bool                        operator!=(const CnumType& rhs);
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.48 1 phase, loop neighbourhood operation with an extra image

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ext, Ngb)
{
    foreach d, s, e in Dst, Src, Ext {
        Ngb.init(s.x, s.y, Src(s), Ext(e));
        foreach n in Ngb.size()
            Ngb.next(n.x, n.y, Src(s - (Ngb.size()/2) + n),
                               Ext(e - (Ngb.size()/2) + n));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class ExtValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTag1Phase     PhaseCategory;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    void                        init(int ix, int iy, SrcValT v1, ExtValT v2);
    void                        next(int nx, int ny, SrcValT v1, ExtValT v2);
    DstValT                     result() const;

    static HxString             className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.49 2 phase, loop neighbourhood operation with an extra image

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ext, Ngb)
{
    foreach d, s, e in Dst, Src, Ext {
        Ngb.init(s.x, s.y, Src(s), Ext(e));
        foreach n in Ngb.size()
            Ngb.next(n.x, n.y, Src(s - (Ngb.size()/2) + n),
                               Ext(e - (Ngb.size()/2) + n));
        Ngb.init2(s.x, s.y, Src(s), Ext(e));
        foreach n in Ngb.size()
            Ngb.next2(n.x, n.y, Src(s - (Ngb.size()/2) + n),
                                Ext(e - (Ngb.size()/2) + n));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class ExtValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTag2Phase     PhaseCategory;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    void                        init(int ix, int iy, SrcValT v1, ExtValT v2);
    void                        next(int nx, int ny, SrcValT v1, ExtValT v2);
```

```
    void                        init2(int ix, int iy, SrcValT v1, ExtValT v2);
    void                        next2(int nx, int ny, SrcValT v1, ExtValT v2);

    DstValT                     result() const;

    static HxString             className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.50 N phase, loop neighbourhood operation with an extra image

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ext, Ngb)
{
    foreach d, s, e in Dst, Src, Ext {
        phase = 1;
        do {
            Ngb.init(phase, s.x, s.y, Src(s), Ext(e));
            foreach n in Ngb.size()
                Ngb.next(n.x, n.y, Src(s - (Ngb.size()/2) + n),
                                   Ext(e - (Ngb.size()/2) + n));
            Ngb.done(phase);
        } while (Ngb.hasNextPhase(phase++));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class ExtValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTagNPhase     PhaseCategory;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    void                        init(int phase, int ix, int iy, SrcValT v1,
                                     ExtValT v2);
    void                        next(int nx, int ny, SrcValT v1, ExtValT v2);
    void                        done(int phase);
    bool                        hasNextPhase(int thisPhase);
    DstValT                     result() const;

    static HxString             className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.51 Neighbourhood operation on 2D images with two extra images

The pattern loops over all pixels in the image and the extra images and applies the neighbourhood functor to the pixels. The result is written to the corresponding position in the result image.

Instantiations of the pattern are invoked via

- **HxImageRep::neighbourhoodOpExtra2**(HxString,HxImageRep,HxImageRep,HxTagList&) (p. 637)

Instantiation is done via the **HxImgFtorNgb2dExtra2** (p. 816) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- ExtraImgSigT is the signature type of the extra image
- ExtraImg2SigT is the signature type of second extra image
- NgbT is the type of the neighbourhood functor

The requirements for the NgbT parameter and an example of its use are given in the sections on variations:

- **1 phase, coordinate enumerated neighbourhood operation with two extra images** (p. 54)
- **1 phase, loop neighbourhood operation with two extra images** (p. 55)
- **2 phase, loop neighbourhood operation with two extra images** (p. 56)
- **N phase, loop neighbourhood operation with two extra images** (p. 57)

Tags for NgbT variations:

- PhaseCategory : **HxTag1Phase** (p. 1194) or **HxTag2Phase** (p. 1195) or **HxTagNPhase** (p. 1200)
- IteratorCategory : **HxTagCnum** (p. 1195) or **HxTagLoop** (p. 1199)

For further reference :

- Method frame : **HxMfNgb** (p. 1026)
- HxImageData member : **HxImageData::neighbourhoodOpExtra2**(HxImageData∗,HxImageData∗,HxImageData∗,HxString,HxTagList&) (p. 602)

3.8.52 1 phase, coordinate enumerated neighbourhood operation with two extra images

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ext, Ext2, Ngb)
{
    foreach d, s, e, e2 in Dst, Src, Ext, Ext2 {
        Ngb.init(s.x, s.y, Src(s), Ext(e), Ext2(e2));
        foreach n in Ngb.begin() .. Ngb.end()
            Ngb.next(n.x, n.y, Src(s + n), Ext(e + n), Ext2(e2 + n));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class ExtValT, class Ext2ValT>
class NgbT
{
public:

    typedef HxTagCnum       IteratorCategory;
    typedef HxTag1Phase     PhaseCategory;

    typedef HxCnum              CnumType;

                      NgbT(HxTagList& tags);
                      ~NgbT();

    HxSizes           size();

    CnumType          begin();
    CnumType          end();

    void              init(int ix, int iy, SrcValT v1, ExtValT v2, Ext2ValT v3);
    void              next(int nx, int ny, SrcValT v1, ExtValT v2, Ext2ValT v3);
    DstValT           result() const;

    static HxString   className();
};
```

The Requirements on CnumType expressed as a class definition are:

```
class CnumType
{
public:
                                CnumType();
                                CnumType(const CnumType& rhs);
    CnumType&                   operator=(const CnumType& rhs);
    int                         x();
    int                         y();
    int                         z();
    void                        inc();
    bool                        operator!=(const CnumType& rhs);
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.53 1 phase, loop neighbourhood operation with two extra images

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ext, Ext2, Ngb)
{
    foreach d, s, e, e2 in Dst, Src, Ext, Ext2 {
        Ngb.init(s.x, s.y, Src(s), Ext(e), Ext2(e2));
        foreach n in Ngb.size()
            Ngb.next(n.x, n.y, Src(s - (Ngb.size()/2) + n),
                               Ext(e - (Ngb.size()/2) + n),
                               Ext2(e2 - (Ngb.size()/2) + n));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class ExtValT, class Ext2ValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTag1Phase     PhaseCategory;

                      NgbT(HxTagList& tags);
                      ~NgbT();

    HxSizes           size();

    void              init(int ix, int iy, SrcValT v1, ExtValT v2, Ext2ValT v3);
    void              next(int nx, int ny, SrcValT v1, ExtValT v2, Ext2ValT v3);
    DstValT           result() const;

    static HxString   className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.54 2 phase, loop neighbourhood operation with two extra images

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ext, Ext2, Ngb)
{
    foreach d, s, e, e2 in Dst, Src, Ext, Ext2 {
        Ngb.init(s.x, s.y, Src(s), Ext(e), Ext2(e2));
        foreach n in Ngb.size()
            Ngb.next(n.x, n.y, Src(s - (Ngb.size()/2) + n),
                               Ext(e - (Ngb.size()/2) + n),
                               Ext2(e2 - (Ngb.size()/2) + n));
        Ngb.init2(s.x, s.y, Src(s), Ext(e), Ext2(e2));
        foreach n in Ngb.size()
            Ngb.next2(n.x, n.y, Src(s - (Ngb.size()/2) + n),
                                Ext(e - (Ngb.size()/2) + n),
                                Ext2(e2 - (Ngb.size()/2) + n));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class ExtValT, class Ext2ValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTag2Phase     PhaseCategory;

                      NgbT(HxTagList& tags);
                      ~NgbT();
```

```
    HxSizes           size();

    void              init(int ix, int iy, SrcValT v1, ExtValT v2, Ext2ValT v3);
    void              next(int nx, int ny, SrcValT v1, ExtValT v2, Ext2ValT v3);

    void              init2(int ix, int iy, SrcValT v1, ExtValT v2, Ext2ValT v3);
    void              next2(int nx, int ny, SrcValT v1, ExtValT v2, Ext2ValT v3);

    DstValT           result() const;

    static HxString   className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.55 N phase, loop neighbourhood operation with two extra images

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ext, Ext2, Ngb)
{
    foreach d, s, e, e2 in Dst, Src, Ext, Ext2 {
        phase = 1;
        do {
            Ngb.init(phase, s.x, s.y, Src(s), Ext(e), Ext2(e2));
            foreach n in Ngb.size()
                Ngb.next(n.x, n.y, Src(s - (Ngb.size()/2) + n),
                                   Ext(e - (Ngb.size()/2) + n),
                                   Ext2(e2 - (Ngb.size()/2) + n));
            Ngb.done(phase);
        } while (Ngb.hasNextPhase(phase++));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class ExtValT, class Ext2ValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTagNPhase     PhaseCategory;

                      NgbT(HxTagList& tags);
                      ~NgbT();

    HxSizes           size();

    void              init(int phase, int ix, int iy, SrcValT v1, ExtValT v2,
                           Ext2ValT v3);
    void              next(int nx, int ny, SrcValT v1, ExtValT v2, Ext2ValT v3);
    void              done(int phase);
    bool              hasNextPhase(int thisPhase);
    DstValT           result() const;
```

```
    static HxString   className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.56 Kernel based neighbourhood operation on 2D images

The pattern loops over all pixels in the image and applies the neighbourhood functor to each pixel. The result is written to the corresponding position in the result image.

Instantiations of the pattern are invoked via

- **HxImageRep::neighbourhoodOp**(HxImageRep,HxString,HxTagList&) (p. 637)

Instantiation is done via the **HxImgFtorKernelNgb2d** (p. 795) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- KerImgSigT is the signature type of the kernel image
- NgbT is the type of the neighbourhood functor

The requirements for the NgbT parameter and an example of its use are given in the sections on variations:

- **1 phase, loop neighbourhood operation with kernel** (p. 58)
- **2 phase, loop neighbourhood operation using a kernel** (p. 59)
- **N phase, loop neighbourhood operation using a kernel** (p. 60)

Tags for NgbT variations:

- PhaseCategory : **HxTag1Phase** (p. 1194) or **HxTag2Phase** (p. 1195) or **HxTagNPhase** (p. 1200)
- IteratorCategory : **HxTagCnum** (p. 1195) or **HxTagLoop** (p. 1199)

For further reference :

- Method frame : **HxMfNgb** (p. 1026)
- HxImageData member : **HxImageData::neighbourhoodOp**(HxImageData∗,HxImageData∗,HxString,HxTagList&) (p. 603)

3.8.57 1 phase, loop neighbourhood operation with kernel

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ker, Ngb)
{
    foreach d, s in Dst, Src {
        Ngb.init(s.x, s.y, Src(s));
        foreach k in Ker
            Ngb.next(k.x, k.y, Src(s - (Ngb.size()/2) + k), Ker(k));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class KerValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTag1Phase     PhaseCategory;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    void                        init(int ix, int iy, SrcValT imVal);
    void                        next(int nx, int ny, SrcValT imVal, KerValT kerVal);
    DstValT                     result() const;

    static HxString             className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.58 2 phase, loop neighbourhood operation using a kernel

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ker, Ngb)
{
    foreach d, s in Dst, Src {
        Ngb.init(s.x, s.y, Src(s));
        foreach k in Ker
            Ngb.next(k.x, k.y, Src(s - (Ngb.size()/2) + k), Ker(k));
        Ngb.init2(s.x, s.y, Src(s));
        foreach k in Ker
            Ngb.next2(k.x, k.y, Src(s - (Ngb.size()/2) + k), Ker(k));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class KerValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTag2Phase     PhaseCategory;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    void                        init(int ix, int iy, SrcValT imVal);
```

```
    void                        next(int nx, int ny, SrcValT imVal, KerValT kerVal);

    void                        init2(int ix, int iy, SrcValT imVal);
    void                        next2(int nx, int ny, SrcValT imVal, KerValT kerVal);

    DstValT                     result() const;

    static HxString             className();
};
```

Example(s):

- instantiation : **HxInstKerNgb2dNormCorrelation_c** (p. **??**), usage : **HxNormalizedCorrelation** (p. 307)

3.8.59 N phase, loop neighbourhood operation using a kernel

Pseudo code of the operation:

```
NeighbourhoodOp(Dst, Src, Ker, Ngb)
{
    foreach d, s in Dst, Src {
        phase = 1;
        do {
            Ngb.init(phase, s.x, s.y, Src(s));
            foreach k in Ker
                Ngb.next(k.x, k.y, Src(s - (Ngb.size()/2) + k), Ker(k));
            Ngb.done(phase);
        } while (Ngb.hasNextPhase(phase++));
        Dst(d) = ngb.result();
    }
}
```

The requirements on the NgbT template parameter expressed as class definition are:

```
template<class DstValT, class SrcValT, class KerValT>
class NgbT
{
public:

    typedef HxTagLoop       IteratorCategory;
    typedef HxTagNPhase     PhaseCategory;

                                NgbT(HxTagList& tags);
                                ~NgbT();

    HxSizes                     size();

    void                        init(int phase, int ix, int iy, SrcValT imVal);
    void                        next(int nx, int ny, SrcValT imVal, KerValT kerVal);
    void                        done(int phase);
    bool                        hasNextPhase(int thisPhase);
    DstValT                     result() const;

    static HxString             className();
};
```

Example(s):

- instantiation : <none>, usage : <none>

3.8.60 Do It Yourself operation

The ”pattern” just offers the data pointers (see **Image data pointers** (p. 15)) to the functor.

Instantiations of the pattern are invoked via

- **HxImageRep::diyOp** (p. 638)

Instantiation is done via the **HxImgFtorDiy** (p. 705) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- DiyT is the type of the DIY functor

The requirements on the DiyT template parameter expressed as class definition are:

```
template<class DstDataPtrT, class SrcDataPtrT>
class DiyT
{
public:
                        DiyT(HxTagList&);

    void                doIt(DstDataPtrT dstPtr, SrcDataPtrT srcPtr,
                             HxSizes dstSize, HxSizes srcSize);

    static HxString     className();
};
```

Example(s):

- instantiation : **HxInstDiyTranspose_c** (p. **??**), usage : **HxTranspose** (p. 373)

For further reference :

- Method frame : **HxMfDiy** (p. 1009)
- HxImageData member : **HxImageData::diyOp** (p. 604)

3.8.61 Set operation

Instantiation is done via the **HxImgFtorSet** (p. 847) functor, with the following template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image

Example(s):

- instantiation : **HxInstantiatorSet_c** (p. **??**)

For further reference :

- HxImageData member : **HxImageData::setPartImage**(HxImageData∗,HxTagList&) (p. 592)

3.8.62 Border set for 2D images

Instantiation is done via the **HxImgFtorSetBorder2d** (p. 849) functor, with the following template parameters:

- ImgSigT is the signature type of the image

Example(s):

- instantiation : **HxImgFtorSetBorder2dInst_c** (p. **??**)

For further reference :

- HxImageData member : **HxImageData::setBorder**(HxTagList&) (p. 592)

3.8.63 Border set for 3D images

Instantiation is done via the **HxImgFtorSetBorder3d** (p. 852) functor, with the following template parameters:

- ImgSigT is the signature type of the image

Example(s):

- instantiation : **HxImgFtorSetBorder3dInst_c** (p. **??**)

For further reference :

- HxImageData member : **HxImageData::setBorder**(HxTagList&) (p. 592)

3.8.64 Geometric operation on 2D images

Instantiations of the pattern are invoked via

- **HxImageRep::geometricOp2d** (p. 638)

For further reference :

- Method frame : **HxMfResize** (p. 1031)
- HxImageData member : **HxImageData::geometricOp2d** (p. 605)

Note : operation is implemented by **HxImageTem2d::geometricOp2d** (p. 698)

Example(s):

- instantiation : <none>, usage : **HxReflect** (p. 332), **HxRotate** (p. 342), **HxScale** (p. 344)

3.8.65 Display RGB operation for 2D images

The pattern loops over all pixels in the image and converts the pixel value to an integer in ARGB formats for display purposes. The result is written to the given integer buffer.

Instantiations of the pattern are invoked via

- **HxImageRep::getRgbPixels2d**(int∗,HxString,int,int,HxGeoIntType) (p. 639)

Instantiation is done via the **HxImgFtorRgb2d** (p. 835) functor, with the following template parameters:

- ImgSigT is the signature type of the image
- RgbT is the type of the rgb pixel functor

The requirements on the RgbT template parameter expressed as a class definition are:

```
template<class ValT, class ValDoubleT>
class RgbT
{
public:
                        RgbT(HxTagList& tags);

    int                 doIt(const ValT& pixV);

    int                 doItDouble(const ValDoubleT& pixV);

    static HxString     className();
};
```

Depending on the display parameters set by the GUI the function doIt will be called with 1 parameter of type ImgSigT::ArithType *or* the doItDouble function will be called with 1 parameter of type ImgSigT::ArithTypeDouble.

Example(s):

- instantiation : **HxInstRgb2dDirect_c** (p. **??**), usage :

For further reference :

- Method frame : <none>
- HxImageData member : **HxImageData::rgbOp** (p. 604)

3.8.66 Display RGB operation for 3D images

The pattern loops over all pixels in the image and converts the pixel value to an integer in ARGB formats for display purposes. The result is written to the given integer buffer.

Instantiations of the pattern are invoked via

- **HxImageRep::getRgbPixels3d** (p. 640)

Instantiation is done via the **HxImgFtorRgb3d** (p. 837) functor, with the following template parameters:

- ImgSigT is the signature type of the image
- RgbT is the type of the rgb pixel functor

The requirements on the RgbT template parameter expressed as a class definition are:

```
template<class ValT, class ValDoubleT>
class RgbT
{
public:
                        RgbT(HxTagList& tags);

    int                 doIt(const ValT& pixV);

    int                 doItDouble(const ValDoubleT& pixV);

    static HxString     className();
};
```

Depending on the display parameters set by the GUI the function doIt will be called with 1 parameter of type ImgSigT::ArithType *or* the doItDouble function will be called with 1 parameter of type ImgSigT::ArithTypeDouble.

Example(s):

- instantiation : **HxInstRgb3dDirect_c** (p. **??**), usage :

For further reference :

- Method frame : <none>
- HxImageData member : **HxImageData::rgbOp** (p. 604)

Chapter 5

Geometry

5.1 BSplines

5.1.1 Terminology

5.1.1.1 Parametric and Sampled Curves

Parametric and *sampled* curves represent ordered sets of points in 2-D or 3-D space.

In the case of a *parametric* curve, it is possible to navigate along all its points with a path parameter defined in a continuous interval. We use $C(t)$ to denote a point in such a curve. We call *path parameter domain* the values which can be assumed by the parameter t.

In the case of a *sampled* curve only some points are represented and they are considered as linked with straight lines. We use $c[j]$ to denote a vertex in such curve, j being the *index* in a vector of sampled points.

Parametric and sampled curves may be open or closed.

One type of parametric curve is called piecewise polynomial curve. In this case each segment of the overall curve is given by two functions (or three, in 3D) which are polynomials of degree d of the path parameter t.

Ex: polynomials for a 2D cubic piecewise polynomial parametric curve:

$$x(t) = a_x t^3 + b_x t^2 + c_x t + d_x$$
$$y(t) = a_y t^3 + b_y t^2 + c_y t + d_y$$

A list of real values called *knots* define the space for the path parameter t.

The coefficients a, b, c, d are computed from given information (ex: control points) using a specific algorithm (or model).

5.1.1.2 Splines

Splines are parametric piecewise polynomial curves defined with a model (the recipe) and control parameters (the ingredients). They can be implemented with different methods to construct different types of curves. Examples: interpolating spline curves, B-spline curves, Beta-spline curves, NURBS, etc.

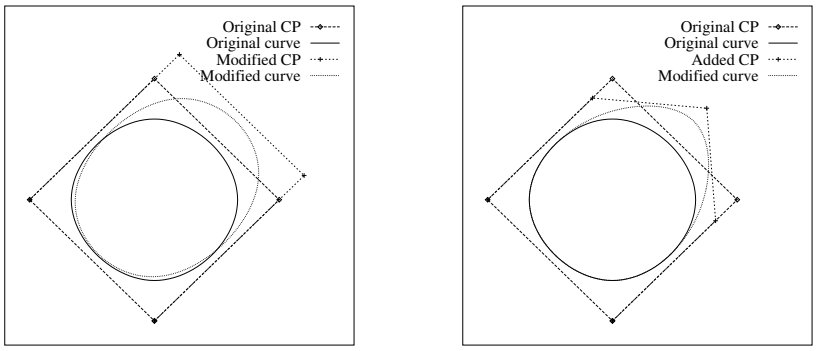

Figure 5.1: Examples of closed cubic B-Spline curves (degree=3). *Left:* Curve with four control points and uniformly spaced knots. Manipulation of one control point affects the whole curve. *Right:* A control point is added (knots become unevenly spaced). Manipulation of one control point affects only a curve interval.

5.1.1.3 B-Spline curves

We are actually interested in *B-spline curves* (see Figure 5.1), which are *splines* implemented as a linear combination of *basis functions* (see Figure 5.2).

We adopt the following terminology and notation:

- degree: degree of the polynomials (= order -1);
- type of curve: determine the usage of control points and knots at ends. In closed curves, knots are used circularly. There are several options for open curves, which we consider different types of curves (ex. with loose ends or with repeated end points);
- knots: ordered list of values that define the path parameter values for navigation along the curve. The values of the knots may be initialized in different ways: uniformly or non-uniformly distributed; generated automatically or explicitly informed by the programmer.
- interval: piece of a curve determined by two path positions t_1, t_2.
- control points (P): geometry information used to instantiate a given B-spline model as a curve in space. The number of control points is dependent on the model, that is, the degree, number of knots, and the curve type.
- basis functions (B): weight of control points for the computation of curve points along the path. Basis functions are completely defined by the knots and the degree of the curve. We refer to these as $B(i)$.
- curve points (C): points in the parametric curve at hand. In this implementation, curve points are never stored in the class, but generated upon request. In continuous curves, we refer to these as $C(t)$. In sampled curves, we refer to curve points as $C(j)$, where j is the index corresponding to a point with fixed t.
- derivatives (d): all derivatives are computed for the path parameter t. We refer to these as $dC(t, order)$, $dB(i, t, order)$, etc.

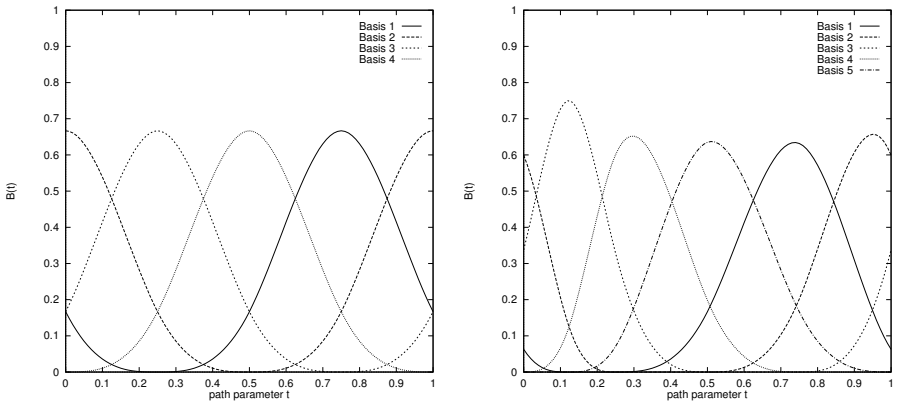

Figure 5.2: Basis functions for the curves in Figure 5.1. *Left:* Uniformly spaced knots. *Right:* Unevenly spaced knots.

5.1.2 Formulae

Introductory sources of information about B-splines are [**?**] and [**?**], which we used as we used as an intermediate step. Later we adopted [**?**] and [**?**]. The code follows the algorithm and notation as indicated in the comments. Below we shortly present the most important formulae used in its implementation.

Keep in mind the following notation:

- d = degree
- o = order $(d + 1)$
- λ_l = l^{th} knot in the sequence
- t = path parameter
- P_i = i^{th} control point
- X_i, Y_i = x and y coordinates of control point P_i
- $C(t)$ = curve point at t, (x, y) coordinates
- $C^{(n)}(t)$ = n^{th} derivative of curve at path path parameter t, (x, y) coordinates
- $P_i^{(n)}(t)$ = contribution of i^{th} control point for the computation of the n^{th} derivative at path parameter t
- $B_{i,o}(t)$ = value of i^{th} basis function of order o at path parameter t
- $B_{i,o}^{(n)}(t)$ = n^{th} derivative of i^{th} basis function of order o at path parameter t

A curve point $C(t)$, $t \in [\lambda_l, \lambda_{l+1})$, is evaluated as follows:

$$x(t) = \sum_{i=l-d}^{l} X_i B_{i,d+1}(t)$$
$$y(t) = \sum_{i=l-d}^{l} Y_i B_{i,d+1}(t) \tag{5.1}$$

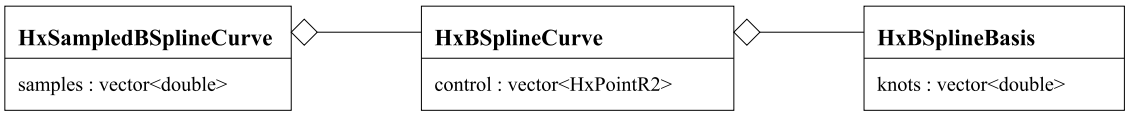

Figure 5.3: BSpline curve classes

The value of a i^{th} basis function of order o at position t - $B_{i,o}(t)$, $t \in [\lambda_i, \lambda_{i+1})$ - is computed with the recursive method proposed by de Boor (see equation 1.24 in [**?**]):

$$\begin{aligned} B_{i,o}(t) &= \frac{t-\lambda_i}{\lambda_{i+o-1}-\lambda_i} B_{i,o-1}(t) + \frac{\lambda_{i+o}-t}{\lambda_{i+o}-\lambda_{i+1}}, B_{i+1,o-1}(t) \\ B_{i,1}(t) &= \begin{cases} 1, & \text{if } t \in [\lambda_i, \lambda_{i+1}), \\ 0, & \text{if } t \notin [\lambda_i, \lambda_{i+1}). \end{cases} \end{aligned} \tag{5.2}$$

The n^{th} derivative of the curve at the path parameter t - $t \in [\lambda_l, \lambda_{l+1})$, is also computed with recursion (see equations 1.39 and 1.40 in [**?**]):

$$C^{(n)}(t) = \prod_{i=1}^{n}(d+1-l) \sum_{i=l-d+n}^{i} P_i^{(n)} B_{i,d+1-n}(t) \tag{5.3}$$

with

$$P_i^{(n)} = \begin{cases} P_i, & \text{if } n = 0, \\ \frac{P_i^{(n-1)} - P_{i-1}^{(n-1)}}{\lambda_{l+d+1-n} - \lambda_l}, & \text{if } n > 0. \end{cases} \tag{5.4}$$

The value of the n^{th} derivative of the i^{th} basis function of order o the path parameter t, $t \in [\lambda_i, \lambda_{i+1})$, is derived from equation 1.25 in [**?**] and computed as follows:

$$\begin{aligned} B_{i,o}^{(n)}(t) &= (o-1)\left\{ \frac{B_{i,o-1}^{(n-1)}(t)}{\lambda_{i+o-1}-\lambda_i} - \frac{B_{i+1,o-1}^{(n-1)}(t)}{\lambda_{i+o}-\lambda_{i+1}} \right\} \\ B_{i,o}^{(0)}(t) &= B_{i,o}(t) \end{aligned} \tag{5.5}$$

5.1.3 Class definition

The class design for the implementation is given in Figure 5.3.

5.1.3.1 `HxBSplineBasis`

Class to represent the B-Spline basis functions, which correspond to the "model."

Internal Representation:

- degree: integer, ≥ 1.
- type of curve: closed, open (the ends are loose) or openRepeatEndPoints (the end points are repeated, and the curve passes through them).

- range of path parameter: real, interval $t \in [minT, maxT)$.
- knots: vector of increasing real numbers. The knots that define the curve intervals are in the range $[minT, maxT]$. Extra knots are added to cope with end point conditions for closed or open curves.

5.1.3.2 `HxBSplineCurve`

A `HxBSplineCurve` results from the association of a `HxBSplineBasis` with a vector of control points used to instantiate it in 2-D.

Internal Representation:

- `HxBSplineBasis`: determines the curve model.
- vector of control points: instantiate curve in 2-D.

This curve is called *continuous* because its manipulation is valid for any value of $t \in [minT, maxT)$.

5.1.3.3 `HxSampledBSplineCurve`

A `HxSampledBSplineCurve` consists of a `HxBSplineCurve` and a vector of t values indicating the path positions where the continuous curve is sampled. This is meant to facilitate the manipulation of sampled curves. Potentially, the implementation of a sampled curve allows for the pre-computation of values to increase performance (e.g. curve points and basis). The current implementation does not take advantage of this.

Internal Representation:

- `HxBSplineCurve`: the continuous curve.
- vector with sampled path parameter positions.

Chapter 6

Registry

6.1 Registry

This chapter:

- **Overview of the registry** (p. 72)
- **Creating a registry** (p. 73)
- **Navigating a registry** (p. 73)

6.1.1 Overview of the registry

The registry (**HxRegistry** (p. 1088)) is a structured set of named values.

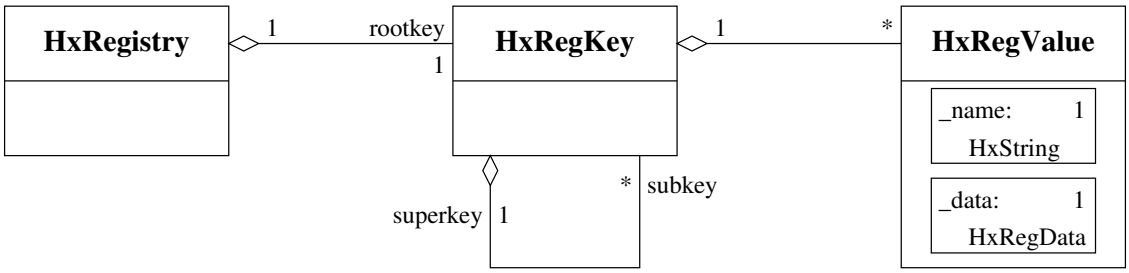

Figure 6.1: Class diagram HxRegistry

A registry value (represented by **HxRegValue** (p. 1104)) is a pair of a name (represented by HxString) and a data object (represented by **HxRegData** (p. 1084)). The data of a value is an integer or a string. Values are grouped in sets, each set is associated with a key (**HxRegKey** (p. 1097)). Keys are structured in the sense that keys have sub keys and form a tree structure. The uniquely identifying name of a key is determined by its path from the root key of the containing tree. In a key name the components of its path are separated by "/". A registry contains one tree of keys, shown in the class diagram as a 1-1 relationship between classes **HxRegistry** (p. 1088) and **HxRegKey** (p. 1097).

An example of the contents of a registry:

```
[/methods/getName]
```

```
"name"="getName"
"nArgs"=0
[/methods/setName]
"name"="setName"
"nArgs"=1
"type0"="string"
```

Note that each value is uniquely identified by the path of its containing key and its name. A tree of registry keys and their associated values has its analogy in a directory tree with files. Keys (directories) can contain both keys as sub keys (subdirectories) and values (files). Both keys and values have a name that is not necessarily unique. Both have a path that uniquely identifies them within the key tree.

6.1.2 Creating a registry

```
class HxRegistry {
                          HxRegistry();
                          ~HxRegistry();

    static HxRegistry&    instance();

    HxRegKey*             insertKey(HxString path);
    void                  eraseKey(HxString path);
};

HxRegistry::instance().insertKey("/methods/getCount");
```

The class **HxRegistry** (p. 1088) provides a default constructor to create a new empty registry. It also grants access to a unique instance of the class. In this respect the class **HxRegistry** (p. 1088) behaves as a singleton class. This unique instance can be used to share a registry throughout the complete library and possible applications. In the Horus library, this instance is the "horus registry".

Keys can be inserted with the method **HxRegistry::insertKey** (p. 1092). The key to be inserted must be specified with its path. Paths are absolute (from the root of the registry), or relative to the "current" key in the registry. Absolute paths start with "/". If a specified key already exists, nothing happens. See below for a description of the current key.

6.1.3 Navigating a registry

A registry can be navigated in two ways. One way is to only use the interface provided by the class **HxRegistry** (p. 1088). The other way is to obtain and manipulate the individual keys of a registry.

Insert and find values

```
class HxRegistry {
    void        insertValue(HxString path, const HxRegData&);
    void        eraseValue(HxString path);

    HxString    findValue(HxString path) const;
    int         valueExists(HxString path) const;
};

HxRegistry::instance().insertValue("/methods/getCount/nArgs", HxRegData(0));
```

If the class interface of **HxRegistry** (p. 1088) is used, values must be specified by path. Again, this can be absolute from the registry root or relative to the current or cursor key of the registry. Note that the result of findValue is always the string representation of the data part of the value. If the value does not exist an

empty string is returned. Since an empty string is a legal data part of a value, the method valueExists is provided to determine the existence of a value.

The cursor key

```
class HxRegistry {
    HxRegKey*   setCursorKey(HxString path);
    HxRegKey*   setCursorUp();
    HxRegKey*   getCursorKey() const;
};
```

Accessing values and keys relative from the cursor key is more efficient since the specified path does not have to be walked down completely from the root for each access. Some methods are provided to manipulate the cursor key.

Accessing values using the methods provided by the class **HxRegistry** (p. 1088) is neither the most efficient nor the most powerful way to manipulate the values of a key. A better way to manipulate the values of a key is using methods provided by the class **HxRegKey** (p. 1097).

Managing the values of a key

```
class HxRegKey {
    void                insertValue(const HxRegValue& value);
    void                eraseValue(HxString name);

    const HxRegValue*   findValue(HxString name) const;
};
```

To obtain a specific key, use the method **HxRegistry::findKey** (p. 1093). A pointer to a key is returned that can be used to manipulate the values of that key or to navigate further in the key tree.

To obtain a pointer to a value use the method **HxRegKey::findValue** (p. 1102) on its containing key. If a value with the specified name does not exist, a null pointer is returned. A registry value contains an object of class **HxRegData** (p. 1084). This object is either a string or an integer. The method **HxRegData::type** (p. 1087) is provided to examine the type of a **HxRegData** (p. 1084) object. With methods **HxRegData::getInt** (p. 1088) and **HxRegData::getString** (p. 1087)} the integer or string value are obtained.

Manipulating a value

```
    int nItems = -1;
    HxRegValue* val = regKey->findValue("nItems");
    if (val) {
        HxRegData data = val->getData();
        if (data.type() == HxRegData::Int) {
            nItems = data.getInt();
        }
    }
```

Chapter 7

Global Image Functions Reference

7.1 HxAbs.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxAbs** (**HxImageRep** im)
  Absolute value.

7.1.1 Detailed Description

7.1.2 Function Documentation

7.1.2.1 HxImageRep L_HXIMAGEREP HxAbs (HxImageRep *im*)

Absolute value.

The function computes the absolute value (see **Pixels** (p. 3)) of all pixels in the input image via a unary pixel operation (see **Images** (p. 8)).

Implementation specifics :

- Pattern : **Unary pixel operation** (p. 26)
- Variation : **Translation invariant unary pixel operation** (p. 26)
- The pixel functor : **HxUpoAbs** (p. 1205)
- Instantiations : **HxInstantiatorAbs_c** (p. **??**)

```
13 {
14     HxString fname("HxAbs");
15 
16     if (im.isNull())
17     {
18         HxGlobalError::instance()->reportError(fname, im.name(), "null image", HxGlobalError::HX_GE_INV
19         return HxImageRep();
20     }
21     return im.unaryPixOp("abs");
22 }
```

7.2 HxAcos.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxAcos** (**HxImageRep** im)

  Arc cosine.

7.2.1 Detailed Description

7.2.2 Function Documentation

7.2.2.1 HxImageRep L_HXIMAGEREP HxAcos (HxImageRep *im*)

Arc cosine.

The function computes the arc cosine (see **Pixels** (p. 3)) of all pixels in the input image via a unary pixel operation (see **Images** (p. 8)).

Implementation specifics : The pixel functor : **HxUpoAcos** (p. 1206). The image functor instantiator : **HxInstantiatorAcos** (p. 864).

```
15 {
16     HxString fname("HxAcos");
17 
18     if (im.isNull())
19     {
20         HxGlobalError::instance()->reportError(fname, im.name(), "null image", HxGlobalError::HX_GE_INV
21         return HxImageRep();
22     }
23     // value between -1 and 1
24     // ook voor vector etc.
25 
26     HxValue vsup = HxPixSup(im);
27     HxValue vinf = HxPixInf(im);
28 
29     if (im.signature().pixelDimensionality() == 1)
30     {
31         if ((((HxScalarDouble) vinf) < -1.0) || (((HxScalarDouble) vsup) > 1.0))
32         {
33             HxGlobalError::instance()->reportError(fname, im.name(), "values not in [-1:1]", HxGlobalEr
34         }
35     }
36     else if (im.signature().pixelDimensionality() == 2)
37     {
38         HxVec2Double vinf2d = (HxVec2Double) vinf;
39         HxVec2Double vsup2d = (HxVec2Double) vsup;
40         if ((vinf2d.x() < -1.0) || (vsup2d.x() > 1.0) ||
41             (vinf2d.y() < -1.0) || (vsup2d.y() > 1.0))
42         {
43             HxGlobalError::instance()->reportError(fname, im.name(), "2D values are not in [-1:1]", HxG
44         }
45     }
46     else if (im.signature().pixelDimensionality() == 3)
47     {

7.20 HxBlob2dList.h File Reference

```
#include "HxStd.h"
#include <vector>
```

Compounds

- class **HxBlob2dList**
  A list of HxBlob2dPtr's, that is pointers to **HxBlob2d** (p. 402)*'s.*

Typedefs

- typedef HxBlob2dList::iterator **HxBlob2dListIter**
  Iterator for **HxBlob2dList** (p. 410).
- typedef HxBlob2dList::const_iterator **HxBlob2dListConstIter**
  Const iterator for **HxBlob2dList** (p. 410).
- typedef **HxBlob2dList::back_insert_iterator HxBlob2dListBackInserter**
  Back inserter for **HxPointList** (p. 1073).

7.20.1 Detailed Description

7.20.2 Typedef Documentation

7.20.2.1 typedef HxBlob2dList::iterator HxBlob2dListIter

Iterator for **HxBlob2dList** (p. 410).

7.20.2.2 typedef HxBlob2dList::const_iterator HxBlob2dListConstIter

Const iterator for **HxBlob2dList** (p. 410).

7.20.2.3 typedef HxBlob2dList::back_insert_iterator HxBlob2dListBackInserter

Back inserter for **HxPointList** (p. 1073).

7.40.2 Function Documentation

7.40.2.1 HxImageRep L_HXIMAGEREP HxConvGauss3d (HxImageRep *img*, double *sigmax*, int *orderDerivx*, double *accuracyx*, double *sigmay*, int *orderDerivy*, double *accuracyy*, double *sigmaz*, int *orderDerivz*, double *accuracyz*)

HxConvGauss3d.

Equivalent to: img.genConv3dSep(gaussx, gaussy, gaussz, ”mul”, ”addAssign”, HxImageRep::ARITH_PREC)

where gaussx, gaussy, gaussz are the 1d double-precision Gaussian kernels based on the respective sets of sigma, orderDeriv, accuracy parameters.

Notice that the kernel is applied to every dimension of the image separately and that the result image has a double-precision pixel type.

Functions

- **HxImageRep** L_HXIMAGEREP **HxDefuz** (**HxImageRep** im, int windowSzX=5, int windowSzY=5, double thr=0.5)

  (from ScilImage Help) defuz() performs a sharpening operation on the grey value image "in" and stores the result in the grey value image "out".

7.48.1 Detailed Description

7.48.2 Function Documentation

7.48.2.1 HxImageRep L_HXIMAGEREP HxDefuz (HxImageRep *im*, int *windowSzX* = 5, int *windowSzY* = 5, double *thr* = 0.5)

(from ScilImage Help) defuz() performs a sharpening operation on the grey value image "in" and stores the result in the grey value image "out".

The image is scanned with a moving window with sizes "filt_x" and "filt_y". For each position, both minimum and maximum value are determined. The values of the minimum, maximum and center pixel value are denoted by MIN, MAX and C resp. The value of the last parameter "thr" is denoted by THR. The new value of the center pixel is calculated as follows:

if(C $<$ MIN + THR $*$ (MAX - MIN)) C = MIN; else C = MAX;

The last parameter THR indicates a bias towards either the local minimum or the local maximum value. In case THR == 0.5 there is no bias towards a direction. This means that if THR == 0.5 the center value is substituted by either min or max depending on whichever of the two is closest in value. If THR has value

0 the result is identical to a local maximum operation and if THR has value 1 the result is that of a local minimum filter. For non-linear sharpening the value of 0.5 is recommended for THR.

The bernsen_threshold() operation is comparable to defuz() without bias. However, instead of replacing the value of the center pixel by the local minimum or maximum, this pixel is assigned 0 or 1. The result of this operation will become very noisy in areas where there is no distinct difference between minimum and maximum. Therefore, with the last parameter "max_diff" the user can indicate the minimum required difference between the local minimum and maximum. If the difference is less, the center pixel is assigned 1 by default.

```
12 {
13     HxTagList tags;
14     HxAddTag(tags, "windowSzX", windowSzX);
15     HxAddTag(tags, "windowSzY", windowSzY);
16     HxAddTag(tags, "thr", thr);
17
18     return im.neighbourhoodOp("defuz", tags);
19
20 }

Dot product .

The function performs dot product (see **Pixels** (p. 3)) on all pixels in the input image via a binary pixel operation (see **Images** (p. 8)).

Implementation specifics : The pixel functor : **HxBpoDot** (p. 428). The image functor instantiator : **HxInstantiatorDotV** (p. 878).

```
13 {
14     HxString fname("HxAddVal");
15
16     if (im.isNull())
17     {

Functions

- **HxImageRep** L_HXIMAGEREP **HxFloor** (**HxImageRep** im)

  Floor.

7.70.1 Detailed Description

7.70.2 Function Documentation

7.70.2.1 HxImageRep L_HXIMAGEREP HxFloor (HxImageRep *im*)

Floor.

The function computes the floor (see **Pixels** (p. 3)) of all pixels in the input image via a unary pixel operation (see **Images** (p. 8)).

Implementation specifics : The pixel functor : **HxUpoFloor** (p. 1224). The image functor instantiator : **HxInstantiatorFloor** (p. 881).

```
13 {
14     HxString fname("HxFloor");
15
16     if (im.isNull())
17     {
18         HxGlobalError::instance()->reportError(fname, im.name(), "null image", HxGlobalError::HX_GE_INV
19         return HxImageRep();
20     }
21
22     return im.unaryPixOp("floor");
23 }
```

7.71 HxFuncBorderOp.h File Reference

```
#include "HxBorderType.h"
```

Functions

- template<class DataPtrT> void **HxFuncBorderMirror2d** (DataPtrT imgPtr, **HxSizes** imgSize, **HxSizes** borderSize)

  Set the border of a 2D image by mirroring.

- template<class DataPtrT> void **HxFuncBorderMirror3d** (DataPtrT imgPtr, **HxSizes** imgSize, **HxSizes** borderSize)

  Set the border of a 3D image by mirroring.

- template<class DataPtrT, class ArithT> void **HxFuncBorderConstant2d** (DataPtrT imgPtr, **HxSizes** imgSize, **HxSizes** borderSize, ArithT value)

  Set the border of a 2D image to a constant value.

- template<class DataPtrT, class ArithT> void **HxFuncBorderConstant3d** (DataPtrT imgPtr, **HxSizes** imgSize, **HxSizes** borderSize, ArithT value)

  Set the border of a 3D image to a constant value.

- template<class DataPtrT> void **HxFuncBorderPropagate2d** (DataPtrT imgPtr, **HxSizes** imgSize, **HxSizes** borderSize)

  Set the border of a 2D image by propagating the "last" value.

- template<class DataPtrT> void **HxFuncBorderPropagate3d** (DataPtrT imgPtr, **HxSizes** imgSize, **HxSizes** borderSize)

  Set the border of a 3D image by propagating the "last" value.

  Dispatch function for binary pixel operation.

7.72.1 Detailed Description

7.72.2 Function Documentation

7.72.2.1 template<class DstDataPtrT, class Src1DataPtrT, class Src2DataPtrT, class BpoT> void HxFuncBpo (DstDataPtrT *dstPtr*, Src1DataPtrT *src1Ptr*, Src2DataPtrT *src2Ptr*, HxSizes *dstSize*, BpoT & *bpo*, HxTagTransInVar *dummy*)

Translation invariant binary pixel operation.

```
26 {
27     int nPix = dstSize.x() * dstSize.y() * dstSize.z();
28     while (--nPix >= 0)
29         dstPtr.writeIncX(bpo.doIt(src1Ptr.readIncX(), src2Ptr.readIncX()));
30 }
```

7.72.2.2 template<class DstDataPtrT, class Src1DataPtrT, class Src2DataPtrT, class BpoT> void HxFuncBpo (DstDataPtrT *dstPtr*, Src1DataPtrT *src1Ptr*, Src2DataPtrT *src2Ptr*, HxSizes *dstSize*, BpoT & *bpo*, HxTagTransVar *dummy*)

Translation variant binary pixel operation.

```
39 {
40     for (int z=0 ; z<dstSize.z() ; z++) {
41         for (int y=0 ; y<dstSize.y() ; y++) {
42             for (int x=0 ; x<dstSize.x() ; x++) {
43                 dstPtr.writeIncX(
```

```
44                      bpo.doIt(src1Ptr.readIncX(), src2Ptr.readIncX(), x, y, z));
45              }
46          }
47      }
48  }
```

7.72.2.3 template<class DstDataPtrT, class Src1DataPtrT, class Src2DataPtrT, class BpoT> void HxFuncBpoDispatch (DstDataPtrT *dstPtr*, Src1DataPtrT *src1Ptr*, Src2DataPtrT *src2Ptr*, HxSizes *dstSize*, BpoT & *bpo*)

Dispatch function for binary pixel operation.

Dispatch is based on the TransVarianceCategory category defined in BpoT. Calls **HxFuncBpo**(DstDataPtrT,Src1DataPtrT,Src2DataPtrT,HxSizes,BpoT&,HxTagTransInVar) (p. 152) or **HxFuncBpo**(DstDataPtrT,Src1DataPtrT,Src2DataPtrT,HxSizes,BpoT&,HxTagTransVar) (p. 152).

```
61  {
62      HxFuncBpo(
63          dstPtr, src1Ptr, src2Ptr, dstSize, bpo,
64          typename BpoT::TransVarianceCategory());
65  }
```

GenConv2dSep : "minimal buffer".

Functions

- template<class KernelT, class ArithType> ArithType * **HxFuncGenConv2dSep_CopyKernel** (KernelT &kernel, ArithType)

  Copy (1d) kernel to an array of ArithT elements.

- template<class DstDataPtrType, class SrcDataPtrType, class KernelT, class PixOpT, class RedOpT> void **HxFuncGenConv2dSepDispatch** (DstDataPtrType dstPtr, SrcDataPtrType srcPtr, KernelT &kernel1, KernelT &kernel2, **HxSizes** dstSize, **HxSizes** srcSize, PixOpT &pixOp, RedOpT &redOp, int vType)

  Dispatch function for GenConv2dSep (see **Global functions for GenConv2dSep** (p. **??**)*) Dispatch is based on the vType parameter.*

7.76.1 Detailed Description

7.76.2 Function Documentation

7.76.2.1 template<class SrcDataPtrT, class ArithT, class PixOpT, class RedOpT> void HxFuncGenConv2dSep_Pix_Xdir (ArithT * *buf*, SrcDataPtrT *srcPtr*, ArithT * *kernel*, int *bufIdx*, int *kerWidth*, PixOpT & *pixOp*, RedOpT & *redOp*, ArithT *neutralElement*) [inline, static]

Pix : X direction.

Does a single genconv between srcPtr and kernel of kerWidth pixels and stores the result at buf[bufIdx]. Memory layout of all srcPtr and kernel is assumed contiguous.

```
82 {
83     ArithT result(neutralElement);
84     for (int k=0; k<kerWidth; k++)
85         redOp.doIt(result, pixOp.doIt(srcPtr.readIncX(), kernel[k]));
86     buf[bufIdx] = result;
87 }
```

7.76.2.2 template<class DstDataPtrT, class ArithT, class PixOpT, class RedOpT> void HxFuncGenConv2dSep_Pix_Ydir (DstDataPtrT *dstPtr*, ArithT * *bufPtr*, ArithT * *kernel*, int *bufWidth*, int *kerWidth*, PixOpT & *pixOp*, RedOpT & *redOp*, ArithT *neutralElement*) [inline, static]

Pix : Y direction.

Does a single genconv between bufPtr and kernel of kerWidth pixels and stores the result at dstPtr. Memory layout of kernel is assumed to be contiguous. Pixels in buf are assumed to be bufWidth elements apart.

```
103 {
104     ArithT result(neutralElement);
```

```
105     int idx = 0;
106     for (int k=0; k<kerWidth; k++) {
107         redOp.doIt(result, pixOp.doIt(bufPtr[idx], kernel[k]));
108         idx += bufWidth;
109     }
110     dstPtr.write(result);
111 }
```

7.76.2.3 template<class SrcDataPtrT, class ArithT, class PixOpT, class RedOpT> void HxFuncGenConv2dSep_Line_Xdir (ArithT * *bufLine*, SrcDataPtrT *srcPtr*, ArithT * *kernel*, int *srcWidth*, int *dstWidth*, int *kerWidth*, PixOpT & *pixOp*, RedOpT & *redOp*) [static]

Line : X direction.

Processes an entire line starting at srcPtr. Calls HxFuncGenConv2dSep_Pix_Xdir "dstWidth" times to do a neighbourhood. The resulting "dstWidth" values are stored on bufLine (contiguous).

```
132 {
133     for (int x=0 ; x<dstWidth ; x++) {
134         HxFuncGenConv2dSep_Pix_Xdir(
135             bufLine, srcPtr, kernel, x, kerWidth,
136             pixOp, redOp, RedOpT::neutralElement());
137         srcPtr.incX();
138     }
139 }
```

7.76.2.4 template<class SrcDataPtrT, class ArithT, class PixOpT, class RedOpT> void HxFuncGenConv2dSep_Line_XdirInc (ArithT * *bufLine*, SrcDataPtrT *srcPtr*, ArithT * *kernel*, int *srcWidth*, int *dstWidth*, int *kerWidth*, PixOpT & *pixOp*, RedOpT & *redOp*) [static]

Line : X direction (inc).

Processes an entire line starting at srcPtr (including the "Pix" variation). The resulting "dstWidth" values are stored in bufLine (contiguous).

This function does the same operation as HxFuncGenConv2dSep_Line_Xdir but the code of HxFuncGenConv2dSep_Pix_Xdir is inserted in the loop (instead of calling the function like HxFuncGenConv2dSep_Line_Xdir does).

```
156 {
157     ArithT neutralElement = RedOpT::neutralElement();
158     for (int x=0 ; x<dstWidth ; x++) {
159         SrcDataPtrT sPtr(srcPtr);
160         ArithT result(neutralElement);
161         for (int k=0; k<kerWidth; k++)
162             redOp.doIt(result, pixOp.doIt(sPtr.readIncX(), kernel[k]));
163         bufLine[x] = result;
164         srcPtr.incX();
165     }
166 }
```

7.76.2.5 template<class SrcDataPtrT, class ArithT, class PixOpT, class RedOpT> void HxFuncGenConv2dSep_Line_XdirVerInc (ArithT * *buf*, SrcDataPtrT *srcPtr*, ArithT * *kernel1*, int *srcWidth*, int *dstWidth*, int *ker1Width*, int *ker2Width*, PixOpT & *pixOp*, RedOpT & *redOp*) [static]

Line : X direction, "vertical buffer" (inc).

Processes an entire line starting at srcPtr (including the "Pix" variation). The resulting "dstWidth" values are stored in buf using a stride ker2Width.

```
180 {
181     ArithT neutralElement = RedOpT::neutralElement();
182     int idx = 0;
183     for (int x=0 ; x<dstWidth ; x++) {
184         SrcDataPtrT sPtr(srcPtr);
185         ArithT result(neutralElement);
186         for (int k=0; k<ker1Width; k++)
187             redOp.doIt(result, pixOp.doIt(sPtr.readIncX(), kernel1[k]));
188         buf[idx] = result;
189         idx += ker2Width;
190         srcPtr.incX();
191     }
192 }
```

7.76.2.6 template<class DstDataPtrT, class ArithT, class PixOpT, class RedOpT> void HxFuncGenConv2dSep_Line_YdirNaiInc (DstDataPtrT *dstPtr*, ArithT * *buf*, ArithT * *kernel*, int *dstWidth*, int *dstHeight*, int *kerWidth*, PixOpT & *pixOp*, RedOpT & *redOp*) [static]

Line : Y direction, naive (inc).

```
201 {
202     ArithT neutralElement = RedOpT::neutralElement();
203     for (int y=0 ; y<dstHeight ; y++) {
204         ArithT result(neutralElement);
205         int idx = 0;
206         for (int k=0; k<kerWidth; k++) {
207             redOp.doIt(result, pixOp.doIt(buf[idx], kernel[k]));
208             idx += dstWidth;
209         }
210         dstPtr.write(result);
211         dstPtr.incY();
212         buf += dstWidth;
213     }
214 }
```

GenConv2dSep : simple.

The conceptually simple implementation basically does the X direction from src to a scratch image, and then the Y direction from the scratch image to dst.

src has a complete border (so both in the X and Y direction). scratch has a border in the Y direction only. dst has no border.

Has two basic versions (designated by vType). The versions do (conceptuelly) the same algorithm in the X direction. With vType == 0 the Y direction is processed in column order (so first the whole column with X=0 is processed before we move on to the next column. With vType == {1,2} the Y direction is processed in a row-wise manner. That is, the kernel is applied at the first position in all columns before it is applied to the next position (again in all columns).

Further variations determine whether the processing of a single kernel is done in a separate function or not.

```
510 {
511     typedef typename KernelT::ArithType ArithType;
512     HxPixelAllocator<ArithType> allocator;
```

```
513
514     int ker1Width = kernel1.sizes().x();
515     ArithType* ker1Array = HxFuncGenConv2dSep_CopyKernel(kernel1, ArithType());
516
517     int ker2Width = kernel2.sizes().x();
518     ArithType* ker2Array = HxFuncGenConv2dSep_CopyKernel(kernel2, ArithType());
519
520     int srcWidth = srcSize.x();
521     int srcHeight = srcSize.y();
522     int dstWidth = dstSize.x();
523     int dstHeight = dstSize.y();
524
525     // Allocate scratchImage of size (dstWidth,srcHeight)
526
527     int scratchSize = dstWidth * srcHeight;
528     ArithType* scratch = allocator.allocate(scratchSize);
529     ArithType* sLine;
530     int x, y;
531

GenConv2dSep : ”vertical buffer”, two-way cyclic (localized computation).

This implementation does the X direction from src to a ”vertical buffer”, and then the Y direction from the buffer to dst.

Processing the image is done in a row-wise manner. The buffer holds just enough (processed) rows of the image to be able to apply the kernel in the Y direction. So, the buffer is used in a cyclic manner.

The buffer is ”vertical” in that the data organization is rotated w.r.t. the images. That is, if pixels are next to eachother on a row in src, their processed results are ker2width apart in the buffer. In other words, the processing of a (horizontal) row in the image is stored in a (vertical) column of the buffer. The size of the buffer is ker2Width x (dstWidth + 1). The 1 is for overflow.

In this variation, the buffer in not only cyclic in the ”X direction” (that is when storing ”row results” in columns) but it is also cyclic in the ”Y direction”. That is, a ”row result” is not always stored at the beginning of a column of the buffer.

src has a complete border (so both in the X and Y direction). the buffer has no border. dst has no border.

```

  Dispatch function for GenConv3d.

7.77.1 Detailed Description

7.77.2 Function Documentation

7.77.2.1 template<class DstDataPtrType, class SrcDataPtrType, class KernelT, class PixOpT, class RedOpT> void HxFuncGenConv3dDispatch (DstDataPtrType *dstPtr*, SrcDataPtrType *srcPtr*, KernelT & *kernel*, HxSizes *dstSize*, PixOpT & *pixOp*, RedOpT & *redOp*, bool *rowpixfunc*)

Dispatch function for GenConv3d.

Parameters:

dstPtr Output image: IS = dstSize, IBS = 0

srcPtr Input image: IS = srcSize, IBS = kernelSize/2, srcPtr is at (IX0,IY0)

kernel Input image, IS = kernelSize, IBS = 0

```
88 {
89     if (rowpixfunc)
90         HxFuncGenConv3d_rowpixfunc(dstPtr, srcPtr, kernel,
91                                    dstSize, pixOp, redOp);
92     else
93         HxFuncGenConv3d_norowpixfunc(dstPtr, srcPtr, kernel,
94                                      dstSize, pixOp, redOp);
95 }
```

149         dstPtr.writeIncX(ngb.result());
150     }
151 }
```

7.81.2.6 template<class DstDataPtrT, class SrcDataPtrT, class NgbT, class KernelT> void HxFuncKernelNgbOp2dDispatch (DstDataPtrT *dstPtr*, SrcDataPtrT *srcPtr*, HxSizes *dstSize*, NgbT & *ngb*, KernelT & *kernel*)

Dispatch function for KernelNgbOp2d (see **Global functions for KernelNgbOp2d** (p. **??**)).

Dispatch is based on the categories defined in NgbT.

Parameters:

dstPtr Output image: IS = dstSize, IBS = 0

srcPtr Input image: IS = dstSize+2∗(ngbSize/2), IBS = ngbSize/2, srcPtr is at (IX0,IY0)

kernel Input image, IS = kernelSize, IBS = 0

```
170 {
171     for(int y=0; y < dstSize.y(); y++) {
172         HxFuncKernelNgbOp2d_Row(dstPtr, srcPtr, y, dstSize.x(), ngb, kernel,
173                                 typename NgbT::PhaseCategory(),
174                                 typename NgbT::IteratorCategory());
175         srcPtr.incY();
176         dstPtr.incY();
177     }
178 }
```

Functions

- template<class DstDataPtrT, class SrcDataPtrT> void **HxFuncSet_Row** (DstDataPtrT dstPtr, SrcDataPtrT srcPtr, int nPix)

Set one line of nPix from src to dst.

- template<> void **HxFuncSet_Row< DataPtr2dDouble, DataPtr2dDouble >** (DataPtr2dDouble dPtr, DataPtr2dDouble sPtr, int nPix)

  Set one line of nPix from src to dst, template specialization for 2d double images.

- template<> void **HxFuncSet_Row< DataPtr2dVec2Double, DataPtr2dVec2Double >** (DataPtr2dVec2Double dPtr, DataPtr2dVec2Double sPtr, int nPix)

  Set one line of nPix from src to dst, template specialization for 2d Vec2Double images.

- template<class DstDataPtrT, class SrcDataPtrT> void **HxFuncSet** (DstDataPtrT dstPtr, SrcDataPtrT srcPtr, **HxSizes** regionSize)

  Set function.

7.91.1 Detailed Description

7.91.2 Function Documentation

7.91.2.1 template<class DstDataPtrT, class SrcDataPtrT> void HxFuncSet_Row (DstDataPtrT *dstPtr*, SrcDataPtrT *srcPtr*, int *nPix*)

Set one line of nPix from src to dst.

```
24 {
25     while (--nPix >= 0)
26         dstPtr.writeIncX(srcPtr.readIncX());
27 }
```

7.91.2.2 template<> void HxFuncSet_Row< DataPtr2dDouble, DataPtr2dDouble > (DataPtr2dDouble *dPtr*, DataPtr2dDouble *sPtr*, int *nPix*) [inline]

Set one line of nPix from src to dst, template specialization for 2d double images.

7.91.2.3 template<> void HxFuncSet_Row< DataPtr2dVec2Double, DataPtr2dVec2Double > (DataPtr2dVec2Double *dPtr*, DataPtr2dVec2Double *sPtr*, int *nPix*) [inline]

Set one line of nPix from src to dst, template specialization for 2d Vec2Double images.

7.91.2.4 template<class DstDataPtrT, class SrcDataPtrT> void HxFuncSet (DstDataPtrT *dstPtr*, SrcDataPtrT *srcPtr*, HxSizes *regionSize*)

Set function.

Sets pixels designated by dstPtr equal to pixels designated by srcPtr. regionSize defines the 3D region of pixels involved.

Note that the function does NOT assume the pixels in the region to be contiguous in memory. However, a row of pixels must be contiguous.

```
69 {
70     int y, z;
71 
72     int lineSize = regionSize.x();
73 
74     for (z = 0; z < regionSize.z(); z++) {
75         for (y = 0; y < regionSize.y(); y++) {
76             SrcDataPtrT sPtr(srcPtr);
77             DstDataPtrT dPtr(dstPtr);
78             sPtr.incXYZ(0, y, z);
79             dPtr.incXYZ(0, y, z);
80             HxFuncSet_Row(dPtr, sPtr, lineSize);
81         }
82     }
83 }
```

7.92 HxFuncUpo.c File Reference

```
#include "HxFuncUpo.h"
```

```
#include "HxCategories.h"
```

Functions

  Translation invariant unary pixel operation.

- template<class DstDataPtrT, class SrcDataPtrT, class UpoT> void **HxFuncUpo** (DstDataPtrT dstPtr, SrcDataPtrT srcPtr, **HxSizes** dstSize, UpoT &upo, **HxTagTransVar** dummy)

  Translation variant unary pixel operation.

- template<class DstDataPtrT, class SrcDataPtrT, class UpoT> void **HxFuncUpoDispatch** (DstDataPtrT dstPtr, SrcDataPtrT srcPtr, **HxSizes** dstSize, UpoT &upo)

  Dispatch function for unary pixel operation.

7.92.1 Detailed Description

7.92.2 Function Documentation

7.92.2.1 template<class DstDataPtrT, class SrcDataPtrT, class UpoT> void HxFuncUpo (DstDataPtrT *dstPtr*, SrcDataPtrT *srcPtr*, HxSizes *dstSize*, UpoT & *upo*, HxTagTransInVar *dummy*)

Translation invariant unary pixel operation.

```
26 {
27     int nPix = dstSize.x() * dstSize.y() * dstSize.z();
28     while (--nPix >= 0)
29         dstPtr.writeIncX(upo.doIt(srcPtr.readIncX()));
30 }
```

7.92.2.2 template<class DstDataPtrT, class SrcDataPtrT, class UpoT> void HxFuncUpo (DstDataPtrT *dstPtr*, SrcDataPtrT *srcPtr*, HxSizes *dstSize*, UpoT & *upo*, HxTagTransVar *dummy*)

Translation variant unary pixel operation.

```
39 {
40     for (int z=0 ; z<dstSize.z() ; z++) {
41         for (int y=0 ; y<dstSize.y() ; y++) {
42             for (int x=0 ; x<dstSize.x() ; x++) {
43                 dstPtr.writeIncX(upo.doIt(srcPtr.readIncX(), x, y, z));
44             }
45         }
46     }
47 }
```

7.92.2.3 template<class DstDataPtrT, class SrcDataPtrT, class UpoT> void HxFuncUpoDispatch (DstDataPtrT *dstPtr*, SrcDataPtrT *srcPtr*, HxSizes *dstSize*, UpoT & *upo*)

Dispatch function for unary pixel operation.

Dispatch is based on the TransVarianceCategory category defined in UpoT. Calls **HxFuncUpo**(DstDataPtrT,SrcDataPtrT,HxSizes,UpoT&,HxTagTransInVar) (p. 224) or **HxFuncUpo**(DstDataPtrT,SrcDataPtrT,HxSizes,UpoT&,HxTagTransVar) (p. 225).

```
60 {
61     HxFuncUpo(
62         dstPtr, srcPtr, dstSize, upo,
63         typename UpoT::TransVarianceCategory());
64 }
```

Functions

- **HxValueList** L_HXIMAGEREP **HxIdentMaskCentralMoments** (**HxImageRep** im, **HxImageRep** mask, **HxPoint** p, **HxSizes** size, int label, int order)
  Compute the central moments of all pixels in "im" identified by "mask".

7.109.1 Detailed Description

7.109.2 Function Documentation

7.109.2.1 HxValueList L_HXIMAGEREP HxIdentMaskCentralMoments (HxImageRep *im*, HxImageRep *mask*, HxPoint *p*, HxSizes *size*, int *label*, int *order*)

Compute the central moments of all pixels in "im" identified by "mask".

"mask" is assumed to be an identification image with pixel type short. The function considers all pixels within the area starting at point "p" with given "size" and a value equal to label.

Implementation specifics :

- Pattern : **Export operation with an extra image** (p. 38)

- Variation : **Translation variant, N phase export operation with an extra image** (p. 40)
- The pixel functor : **HxExportExtraIdentMaskCentralMoments** (p. 530)
- Instantiations : **HxInstExportExtraIdentMaskCentralMoments_c** (p. **??**)

```
15 {
16     HxValueList valList;
17     HxBoundingBox bb(size);
18     bb = bb.translate(p);
19     HxTagList tags;
20     HxAddTag(tags, "maskVal", label);
21     HxAddTag(tags, "boundingBox", bb);
22     HxAddTag(tags, "order", order);
23     HxAddTag(tags, "valList", &valList);
24     im.exportOpExtra("identMaskCentralMoments", mask, tags);
25     return valList;
26 }
```

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxKuwahara** (**HxImageRep** im, int width, int height)

  Performs the Kuwahara Filter.

7.141.1 Detailed Description

7.141.2 Function Documentation

7.141.2.1 HxImageRep L_HXIMAGEREP HxKuwahara (HxImageRep *im*, int *width*, int *height*)

Performs the Kuwahara Filter.

This filter is an edge-preserving filter.

(a a ab b b) (a a ab b b) (ac ac abcd bd bd) (c c cd d d) (c c cd d d)

In each of the four regions (a, b, c, d), the mean brightness and the variance are calculated. The output value of the center pixel (abcd) in the window is the mean value of that region that has the smallest variance. This filter is an edge-preserving filter, which smoothes the images without disturbing the sharpness and the position of edges.

```
12 {
13     //the window width and height have to be ODD
14     HxTagList tags;

7.169 HxMakeFromShortData.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxMakeFromShortData** (int pixelDimensionality, int dimensions, **HxSizes** sizes, short ∗data)

  Make a new image with given signature and sizes.

7.169.1 Detailed Description

7.169.2 Function Documentation

7.169.2.1 HxImageRep L_HXIMAGEREP HxMakeFromShortData (int *pixelDimensionality*, int *dimensions*, HxSizes *sizes*, short * *data*)

Make a new image with given signature and sizes.

Pixel data is initialized from given values.

```
15 {
16     return HxImageFactory::instance().fromShortData(pixelDimensionality,
17                 dimensions, sizes, data);
18 }
```

7.170 HxMakeFromSignature.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxMakeFromSignature** (const **HxImageSignature** &signature, **HxSizes** sizes)

  Make an uninitialized image with given signature and sizes.

7.170.1 Detailed Description

7.170.2 Function Documentation

7.170.2.1 HxImageRep L_HXIMAGEREP HxMakeFromSignature (const HxImageSignature & *signature*, HxSizes *sizes*)

Make an uninitialized image with given signature and sizes.

```
14 {
15     HxString fname("HxMakeFromSignature");
16
17     if ((signature.pixelDimensionality() < 1) || (signature.pixelDimensionality() > 3))

7.207.1 Detailed Description

7.207.2 Function Documentation

7.207.2.1 HxImageRep L_HXIMAGEREP HxPercentile (HxImageRep *im*, int *neighSize*, double *perc*)

Percentile filter.

Implementation specifics : The neighbourhood functor : **HxNgbPercentile2d** (p. 1060). The image functor instantiator : **HxInstNgbPercentile2d_c** (p. **??**).

```
14 {
15     HxString fname("HxPercentile");
16
17     if (im.isNull())
18     {
19         HxGlobalError::instance()->reportError(fname, im.name(), "null image", HxGlobalError::HX_GE_INV
20         return HxImageRep();
21     }
22
23     if (im.dimensionality() != 2)
24     {
25         HxGlobalError::instance()->reportError(fname, im.name(), "Only valid for 2D images", HxGlobalEr
26         return HxImageRep();
27     }
28     if (neighSize < 1)
29     {
30         HxGlobalError::instance()->reportError(fname, "neighbourhoud too small", HxGlobalError::HX_GE_I
31         return HxImageRep();
32     }
33     if ((neighSize > im.dimensionSize(1)) || (neighSize > im.dimensionSize(2)))
34     {
35         HxGlobalError::instance()->reportError(fname, "neighbourhoud too large", HxGlobalError::HX_GE_I
36         return HxImageRep();
37     }
38     if ((perc < 0) || (perc > 1))
39     {
40         HxGlobalError::instance()->reportError(fname, "percentile in [0:1]", HxGlobalError::HX_GE_INVAI
41         return HxImageRep();
42     }
43
44     HxTagList tags;
45     HxAddTag(tags, "size", neighSize);
46     HxAddTag(tags, "percentile", perc);
47
48     return im.neighbourhoodOp("percentile", tags);
49 }
```

  Pixel infimum.

7.208.1 Detailed Description

7.208.2 Function Documentation

7.208.2.1 HxValue L_HXIMAGEREP HxPixInf (HxImageRep *im*)

Pixel infimum.

The function computes the infimum (see **Pixels** (p. 3)) of all pixels in the input image via a reduce operation (see **Images** (p. 8)).

Implementation specifics : The pixel functor : **HxBpoInfAssign** (p. 437). The image functor instantiator : **HxInstantiatorInfReduce** (p. 887).

```
13 {
14     HxString fname("HxPixInf");
15 
16     if (im.isNull())
17     {
18         HxGlobalError::instance()->reportError(fname, im.name(), "null image", HxGlobalError::HX_GE_INV
19         return HxValue();
20     }
21 
22     return im.reduceOp("infAssign");
23 }
```

22     return im.reduceOp("supAssign");
23 }
```

7.214 HxPoint.h File Reference

```
#include "HxVec3Double.h"
```

Typedefs

- typedef **HxVec3Double HxPoint**
  Definition of a point in 3D space.

7.214.1 Detailed Description

7.214.2 Typedef Documentation

7.214.2.1 typedef HxVec3Double HxPoint

Definition of a point in 3D space.

Uses floating point (double) coordinates.

7.215 HxPointInt.h File Reference

```
#include "HxVec3Int.h"
```

Typedefs

- typedef **HxVec3Int HxPointInt**
  Definition of a point in 3D space using integer coordinates.

7.215.1 Detailed Description

7.215.2 Typedef Documentation

7.215.2.1 typedef HxVec3Int HxPointInt

Definition of a point in 3D space using integer coordinates.

HxPointInt is used primarily to specify the position of a pixel in an image.

7.216 HxPointList.h File Reference

```
#include "HxPoint.h"
#include <list>
```

Compounds

- class **HxPointList**
  Class definition for list of HxPoint's.

Typedefs

- typedef HxPointList::iterator **HxPointListIter**
  Iterator for **HxPointList** (p. 1073).
- typedef HxPointList::const_iterator **HxPointListConstIter**
  Const iterator for **HxPointList** (p. 1073).
- typedef **HxPointList::back_insert_iterator HxPointListBackInserter**
  Back inserter for **HxPointList** (p. 1073).

7.216.1 Detailed Description

7.216.2 Typedef Documentation

7.216.2.1 typedef HxPointList::iterator HxPointListIter

Iterator for **HxPointList** (p. 1073).

7.216.2.2 typedef HxPointList::const_iterator HxPointListConstIter

Const iterator for **HxPointList** (p. 1073).

7.216.2.3 typedef HxPointList::back_insert_iterator HxPointListBackInserter

Back inserter for **HxPointList** (p. 1073).

Functions

- **HxImageRep** L_HXIMAGEREP **HxRightShiftVal** (**HxImageRep** im, **HxValue** val)

  Right shift.

7.230.1 Detailed Description

7.230.2 Function Documentation

7.230.2.1 HxImageRep L_HXIMAGEREP HxRightShiftVal (HxImageRep *im*, HxValue *val*)

Right shift.

The function performs addition (see **Pixels** (p. 3)) on all pixels in the input image via a binary pixel operation (see **Images** (p. 8)).

Implementation specifics : The pixel functor : **HxBpoRightShift** (p. 458). The image functor instantiator : **HxInstantiatorRightShiftV** (p. 909).

```
13  {
14      HxString fname("HxRighShiftVal");
15
16      if (im.isNull())
17      {
18          HxGlobalError::instance()->reportError(fname, im.name(), "null image", HxGlobalError::HX_GE_INV
19          return HxImageRep();
20      }
21
22      if (im.signature().pixelDimensionality() != 1)
23      {
24          HxGlobalError::instance()->reportError(fname, "logical operators are only valid for scalar imag
25          return HxImageRep();
26      }
27
28      if (im.signature().pixelType() != INT_VALUE)
29      {
30          HxGlobalError::instance()->reportError(fname, "logical operators are only valid on integer imag
```

```
31          return HxImageRep();
32      }
33
34      if (val.tag() != HxValue::SI)
35      {

```

Compounds

- class **HxTagList**
  A list of tags.

Functions

- std::ostream & **operator**<< (std::ostream &os, const **HxTagList** &tags)
- template<class ValT> void **HxAddTag** (**HxTagList** &tags, **HxString** name, ValT v)
  Add a tag to the list of tags.
- template<class ValT> ValT **HxGetTag** (const **HxTagList** &tags, **HxString** name)
  Get a tag from the list of tags.
- template<class ValT> ValT **HxGetTag** (const **HxTagList** &tags, **HxString** name, ValT defV)
  Get a tag from the list of tags.
- bool **HxTagIsSet** (const **HxTagList** &tags, **HxString** name)
  Check if tag is set.
- **HxTagList** & **HxMakeTagList** ()
  Function to return a reference to a garbage dump taglist.

7.260.1 Detailed Description

7.260.2 Function Documentation

7.260.2.1 template<class ValT> void HxAddTag (HxTagList & *tags*, HxString *name*, ValT *v*) [inline]

Add a tag to the list of tags.

```
92 {
93     typedef HxTagTem<ValT>  Tag;
94     tags.addTag(new Tag(name, v));
95 }
```

7.260.2.2 template<class ValT> ValT HxGetTag (const HxTagList & *tags*, HxString *name*) [inline]

Get a tag from the list of tags.

```
102 {
103     typedef HxTagTem<ValT>* TagPtr;
104     TagPtr t = TagPtr(tags.getTag(name));
105     ValT v;
106     if (t)

7.271 HxUnaryMin.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxUnaryMin** (**HxImageRep** im)

  Unary minimum.

7.271.1 Detailed Description

7.271.2 Function Documentation

7.271.2.1 HxImageRep L_HXIMAGEREP HxUnaryMin (HxImageRep *im*)

Unary minimum.

The function computes the unary minimum (see **Pixels** (p. 3)) of all pixels in the input image via a unary pixel operation (see **Images** (p. 8)).

Implementation specifics : The pixel functor : **HxUpoMin** (p. 1230). The image functor instantiator : **HxInstantiatorUpoMin** (p. 925).

```
13 {
14     return im.unaryPixOp("min");
15 }
```

7.272 HxUnaryProduct.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxUnaryProduct** (**HxImageRep** im)
  Unary product.

7.272.1 Detailed Description

7.272.2 Function Documentation

7.272.2.1 HxImageRep L_HXIMAGEREP HxUnaryProduct (HxImageRep *im*)

Unary product.

The function computes the unary product (see **Pixels** (p. 3)) of all pixels in the input image via a unary pixel operation (see **Images** (p. 8)).

Implementation specifics : The pixel functor : **HxUpoProduct** (p. 1239). The image functor instantiator : **HxInstantiatorProduct** (p. 907).

```
13 {
14     return im.unaryPixOp("product");
15 }
```

7.273 HxUnarySum.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxUnarySum** (**HxImageRep** im)
  Unary sum.

7.273.1 Detailed Description

7.273.2 Function Documentation

7.273.2.1 HxImageRep L_HXIMAGEREP HxUnarySum (HxImageRep *im*)

Unary sum.

The function computes the unary sum (see **Pixels** (p. 3)) of all pixels in the input image via a unary pixel operation (see **Images** (p. 8)).

Implementation specifics : The pixel functor : **HxUpoSum** (p. 1247). The image functor instantiator : **HxInstantiatorSum** (p. 920).

```
13 {
14     return im.unaryPixOp("sum");
15 }
```

7.274 HxUniform.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxUniform** (**HxImageRep** im, **HxSizes** sizes)
  Uniform filter.

7.274.1 Detailed Description

7.274.2 Function Documentation

7.274.2.1 HxImageRep L_HXIMAGEREP HxUniform (HxImageRep *im*, HxSizes *sizes*)

Uniform filter.

```
15 {
16     HxString fname("HxUniform");
17
18     if (im.isNull())
19     {
20         HxGlobalError::instance()->reportError(fname, im.name(), "null image", HxGlobalError::HX_GE_INV
21         return HxImageRep();
22     }
23
24     if ((sizes.x() < 1) || (sizes.x() > im.dimensionSize(1)))
25     {
26         HxGlobalError::instance()->reportError(fname, "illegal size x", HxGlobalError::HX_GE_INVALID);
27         return HxImageRep();
28     }
29

```

Namespaces

- namespace **HxInstantiatorSetPartImage_c**

Compounds

- struct **HxInstantiatorSetPartImg**
  Instantiator for unary pixel operation.

Functions

- int **HxUpoSetPartImageInst** ()
  Dummy function to instantiate variables in this file.

7.276.1 Detailed Description

7.276.2 Function Documentation

7.276.2.1 int HxUpoSetPartImageInst ()

Dummy function to instantiate variables in this file.

```
64 {
65     int i = 3;
66     return i;
67 }
```

7.277 HxValleyRemoval.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxValleyRemoval** (**HxImageRep** im, int conn, int minarea)

7.277.1 Detailed Description

7.278 HxValueList.h File Reference

```
#include "HxValue.h"
#include <list>
```

Compounds

- class **HxValueList**
  Class definition for list of **HxValue** (p. 1253)*'s.*

Typedefs

- typedef HxValueList::iterator **HxValueListIter**
  Iterator for **HxValueList** (p. 1261).
- typedef HxValueList::const_iterator **HxValueListConstIter**
  Const iterator for **HxValueList** (p. 1261).
- typedef **HxValueList::back_insert_iterator HxValueListBackInserter**
  Back inserter for **HxValueList** (p. 1261).

7.278.1 Detailed Description

7.278.2 Typedef Documentation

7.278.2.1 typedef HxValueList::iterator HxValueListIter

Iterator for **HxValueList** (p. 1261).

7.278.2.2 typedef HxValueList::const_iterator HxValueListConstIter

Const iterator for **HxValueList** (p. 1261).

7.278.2.3 typedef HxValueList::back_insert_iterator HxValueListBackInserter

Back inserter for **HxValueList** (p. 1261).

7.279 HxValueType.h File Reference

```
#include "HxIoFwd.h"
#include "HxString.h"
```

Enumerations

- enum **HxValueType** { **INT_VALUE**, **REAL_VALUE**, **COMPLEX_VALUE** }
  The type of a **HxValue** (p. 1253).

Functions

- std::ostream & **HxValueType_put** (std::ostream &os, **HxValueType** val)
- std::ostream & **operator**<< (std::ostream &os, **HxValueType** val)
- **HxString makeString** (**HxValueType** val)

7.279.1 Detailed Description

7.279.2 Enumeration Type Documentation

7.279.2.1 enum HxValueType

The type of a **HxValue** (p. 1253).

Enumeration to make a distinction between integer values (INT_VALUE) and real/floating point values (REAL_VALUE), and complex values (COMPLEX_VALUE). operator<< has been overloaded to print HxValueTypes on a stream.

```
26 { INT_VALUE, REAL_VALUE, COMPLEX_VALUE };
```

7.280 HxVec2Byte.h File Reference

```
#include "HxVec2Tem.h"
#include "HxByte.h"
```

Typedefs

- typedef **HxVec2Tem**< **HxByte** > **HxVec2Byte**

  Type definition for vector of 2 HxByte's (unsigned chars).

Variables

- **HxVec2Byte dummyVec2Byte**

7.280.1 Detailed Description

7.280.2 Typedef Documentation

7.280.2.1 typedef HxVec2Tem<HxByte> HxVec2Byte

Type definition for vector of 2 HxByte's (unsigned chars).

7.281 HxVec2Float.h File Reference

```
#include "HxVec2Tem.h"

7.285.1 Detailed Description

7.285.2 Typedef Documentation

7.285.2.1 typedef HxVec3Tem<short> HxVec3Short

Type definition for vector of 3 shorts.

7.286 HxWatershed.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxWatershed** (**HxImageRep** input, int conn)

  Watershed function creates the result image by detecting the domain of the catchment basins of "im" using the "flooding definition", according to the connectivity defined by "sf".

7.286.1 Detailed Description

7.286.2 Function Documentation

7.286.2.1 HxImageRep L_HXIMAGEREP HxWatershed (HxImageRep *input*, int *conn*)

Watershed function creates the result image by detecting the domain of the catchment basins of "im" using the "flooding definition", according to the connectivity defined by "sf".

According to the flag "linereg" the result image will be a labeled image of the catchment basins domain or just a binary image that presents the watershed lines.

Implementation based on Vincent algorithm (PAMI) Evaluation using SDC Matlab toolbox (www.morph.com)

- `im` is the input image (**HxImageRep** (p. 620))
- `mark` is the marker image (**HxImageRep** (p. 620))
- `sf` is the structuring function; default type is crossSF (**HxSF** (p. 1186))
- `linereg` HxString. Possible values 'LINES' or ' REGIONS'. Default: "LINES".

Returns:
the watershed Image, ImageRep

∗ references: L. Vincent and P. Soille, Watersheds in digital spaces: an efficient algorithm based on immersion simulations, IEEE Transactions on Pattern Analysis and Machine Intelligence. 13:583-598, 1991.

Remarks:
this queue based implementation is based on sorted lists of pixels for color images there is no partial ordering therefore we cannot use this for color

```
433 {
434     HxTagList tags;
435     HxAddTag(tags, "connectivity", conn);
436     HxImageRep mask=input;
437     //to speedup compute here the min and max gray values
438     int     hmin,hmax;
439     hmin = HxPixMin(input).HxScalarIntValue().x();
440     hmax = HxPixMax(input).HxScalarIntValue().x();
441     HxAddTag(tags,"hmin",hmin);
442     HxAddTag(tags,"hmax",hmax);
443
444     //for more speedup, use a histogram to indicate the existing gray levels
445
446     HxImageRep out = input.queueBasedOp(mask, "qWaterShedLV", tags);
447
448     //because the LucVincent algorithm doesn't get all the watershed points
449     //this neigborhoud operator replaces the smallest label with wshed value
450     HxAddTag(tags, "conn", conn);
451     HxAddTag(tags, "wshedval", WSHEDVAL);
452
453     out = out.neighbourhoodOp("lwshed", tags);
454
455
456     return out;
457 }
```

7.287 HxWatershedMarkers.h File Reference

```
#include "HxImageRep.h"
```

Functions

- **HxImageRep** L_HXIMAGEREP **HxWatershedMarkers** (**HxImageRep** input, **HxImageRep** mask, int conn=4, bool doLabelMask=false)

  Watershed from markers.

7.287.1 Detailed Description

7.287.2 Function Documentation

7.287.2.1 HxImageRep L_HXIMAGEREP HxWatershedMarkers (HxImageRep *input*, HxImageRep *mask*, int *conn* = 4, bool *doLabelMask* = false)

Watershed from markers.

- `im` is the input image (**HxImageRep** (p. 620))
- `mask` is the marker image (**HxImageRep** (p. 620))
- `conn` is the connectivity (4 or 8)
- `doLabelMask` (bool) indicate whether the marker images needs to be labeled before, or not

Returns:
the watershed Image, ImageRep

Remarks:
this version of watershed does not consider a cost function. See HxWatershedMarker2, for a cost-based implementation

R. Lotufo and A. Falcao. "The ordered queue and the optimality of the watershed approaches." In Mathematical Morphology and its Application to Image and Signal Processing, pages 341-350, Dordrecht, The Netherlands, 2000.

```
200 {

Functions

- **HxValue** L_HXIMAGEREP **HxWeightMaskSum** (**HxImageRep** im, **HxImageRep** mask, **HxPoint** p)

  Compute the sum of all pixels in "im" weighed by "mask".

7.290.1 Detailed Description

7.290.2 Function Documentation

7.290.2.1 HxValue L_HXIMAGEREP HxWeightMaskSum (HxImageRep *im*, HxImageRep *mask*, HxPoint *p*)

Compute the sum of all pixels in "im" weighed by "mask".

The function considers all pixels within the area starting at point "p" with a size equal to that of "mask".

Implementation specifics :

- Pattern : **Export operation with an extra image** (p. 38)
- Variation : **Translation invariant, 1 phase export operation with an extra image** (p. 38)
- The pixel functor : **HxExportExtraWeightMaskSum** (p. 546)
- Instantiations : HxExportExtraWeightMaskSum_c

```
13 {
14     HxBoundingBox bb(mask.sizes());
15     HxTagList tags;
16     HxAddTag(tags, "boundingBox", bb);
17     HxAddTag(tags, "doOffsetExtra", false);
18     im.exportOpExtra("weightMaskSum", mask, tags);
19     HxValue v = HxGetTag<HxValue>(tags, "result");
20     return v;
21 }
```

7.291 HxWriteFile.h File Reference

```
#include "HxImageRep.h"
```

Functions

- bool L_HXIMAGEREP **HxWriteFile** (**HxImageRep** im, **HxString** fileName)

  Write image to file using HxImgFileIo.

7.291.1 Detailed Description

7.291.2 Function Documentation

7.291.2.1 bool L_HXIMAGEREP HxWriteFile (HxImageRep *im*, HxString *fileName*)

Write image to file using HxImgFileIo.

```
19 {
20     HxString fname("HxWriteFile");
21 
22     if (im.isNull())

Chapter 8

Class Reference

8.1 DeviceEnumerator Class Reference

Enumerates system devices (that can be used as filters).

`#include <DeviceEnumerator.h>`

Public Methods

- **DeviceEnumerator** (REFCLSID devClass=CLSID_VideoInputDeviceCategory)
- ~**DeviceEnumerator** ()
- char ** **getNames** ()
- HRESULT **getFilter** (int num, IBaseFilter **filter)
- HRESULT **getFilter** (const char *name, IBaseFilter **filter)

8.1.1 Detailed Description

Enumerates system devices (that can be used as filters).

devClass can be (among others) :

- CLSID_VideoInputDeviceCategory: Video capture category.
- CLSID_LegacyAmFilterCategory: Filter category.
- CLSID_VideoCompressorCategory: Video compressor category.
- CLSID_AudioCompressorCategory: Audio compressor category.
- CLSID_AudioInputDeviceCategory: Audio source category.
- CLSID_AudioRendererCategory: Audio renderer category.
- CLSID_MidiRendererCategory: Midi renderer category.

The documentation for this class was generated from the following files:

- **DeviceEnumerator.h**
- DeviceEnumerator.c

8.2 HxArrowR2 Class Reference

Class definition for arrows in R2.

`#include <HxArrowR2.h>`

Public Methods

- **HxArrowR2** ()

  Constructor.

- **HxArrowR2** (const **HxVectorR2** &v)

  Construct from vector (origin = (0,0)).

- **HxArrowR2** (const **HxPointR2** &p, const **HxVectorR2** &v)

  Construct from given point and vector.

- **HxArrowR2** (double ox, double oy, double dx, double dy)

  Construct from given point and vector.

- ~**HxArrowR2** ()

  Destructor.

- **HxPointR2 origin** ()

  Get the origin.

- **HxVectorR2 displace** ()

  Get the displacement.

- STD_OSTREAM & **put** (STD_OSTREAM &) const

  Put the arrow on the given stream.

8.2.1 Detailed Description

Class definition for arrows in R2.

An arrow has a position (origin) and a direction (displace). Both have real-value coordinates (R2).

8.2.2 Constructor & Destructor Documentation

8.2.2.1 HxArrowR2::HxArrowR2 () `[inline]`

Constructor.

```
60 {
61 }
```

8.2.2.2 HxArrowR2::HxArrowR2 (const HxVectorR2 & *v*) [inline]

Construct from vector (origin = (0,0)).

```
64                                          : _origin(0, 0), _displace(v)
65 {
66 }
```

8.2.2.3 HxArrowR2::HxArrowR2 (const HxPointR2 & *p*, const HxVectorR2 & *v*) [inline]

Construct from given point and vector.

```
69                                                                  : _origin(p),
70                                                                    _displace(v)
71 {
72 }
```

8.2.2.4 HxArrowR2::HxArrowR2 (double *ox*, double *oy*, double *dx*, double *dy*) [inline]

Construct from given point and vector.

```
75                                                                  :
76                                              _origin(ox, oy), _displace(dx, dy)
77 {
78 }
```

8.2.2.5 HxArrowR2::~HxArrowR2 () [inline]

Destructor.

```
82 {
83 }
```

8.2.3 Member Function Documentation

8.2.3.1 HxPointR2 HxArrowR2::origin () [inline]

Get the origin.

```
87 {
88     return _origin;
89 }
```

8.2.3.2 HxVectorR2 HxArrowR2::displace () [inline]

Get the displacement.

```
93 {
94     return _displace;
95 }
```

8.2.3.3 STD_OSTREAM & HxArrowR2::put (STD_OSTREAM & *os*) const [inline]

Put the arrow on the given stream.

```
99 {
100     return os << _origin <<  " " << _displace;
101 }
```

The documentation for this class was generated from the following file:

- **HxArrowR2.h**

8.3 HxBlob2d Class Reference

Class definition for a blob in a 2D image.

`#include <HxBlob2d.h>`

Public Methods

- **HxBlob2d** ()
  Constructor.
- **HxBlob2d** (int label, int xmin, int ymin, int width, int height)
  Constructor.
- ~**HxBlob2d** ()
  Destructor.
- int **ident** () const
  Get the identifier of this blob.
- int **getLabel** () const
  Get the label of this blob (unique only within the labeled image.
- **HxPoint startMaer** () const
  Get the upper left corner of the MAER.
- **HxSizes sizeMaer** () const
  Get the sizes of the MAER.
- template<class T> void **addFeature** (**HxString** name, const T &val)
  Add combination name,val to the list of features.
- template<class T> void **addFeature** (**HxNameTable::sizeType** id, const T &val)
  Add combination id,val to the list of features.
- template<class T> bool **getFeature** (**HxString** name, T &val) const
  Get feature idetified by name from the list.

- template<class T> bool **getFeature** (**HxNameTable::sizeType** id, T &val) const

  Get feature idetified by name from the list.

- int **getFeatureInt** (**HxString** name) const

  Wrapper around getFeature for int's.

- **HxValue getFeatureValue** (**HxString** name) const

  Wrapper around getFeature for **HxValue** (p. 1253)*'s.*

- STD_OSTREAM & **put** (STD_OSTREAM &os) const

  Put blob on stream.

Static Public Methods

- std::vector< **HxString** > **getFeatureNames** ()

  Get all feature names.

8.3.1 Detailed Description

Class definition for a blob in a 2D image.

Basically, a blob is a label in an identification image. In other words, a blob is a set of pixels that are "connected".

8.3.2 Constructor & Destructor Documentation

8.3.2.1 HxBlob2d::HxBlob2d ()

Constructor.

```
24 {
25     _ident = _nr++;
26 }
```

8.3.2.2 HxBlob2d::HxBlob2d (int *label*, int *xmin*, int *ymin*, int *width*, int *height*)

Constructor.

```
41 {
42     _ident = _nr++;
43     _label = label;
44     _xmin = xmin;
45     _ymin = ymin;
46     _width = width;
47     _height = height;
48 }
```

8.3.2.3 HxBlob2d::~HxBlob2d ()

Destructor.

```
51 {
52 }
```

8.3.3 Member Function Documentation

8.3.3.1 int HxBlob2d::ident () const

Get the identifier of this blob.

```
56 {
57     return _ident;
58 }
```

8.3.3.2 int HxBlob2d::getLabel () const

Get the label of this blob (unique only within the labeled image.

```
76 {
77     return _label;
78 }
```

8.3.3.3 HxPoint HxBlob2d::startMaer () const

Get the upper left corner of the MAER.

```
82 {
83     return HxPoint(_xmin, _ymin, 0);
84 }
```

8.3.3.4 HxSizes HxBlob2d::sizeMaer () const

Get the sizes of the MAER.

```
88 {
89     return HxSizes(_width, _height, 1);
90 }
```

8.3.3.5 template<class T> void HxBlob2d::addFeature (HxString *name*, const T & *val*) [inline]

Add combination name,val to the list of features.

```
77     {
78         HxNameTable::sizeType id = _featNameTable.getId(name);
79         addFeature(id, val);
80     }
```

8.3.3.6 template<class T> void HxBlob2d::addFeature (HxNameTable::sizeType *id*, const T & *val*) [inline]

Add combination id,val to the list of features.

```
85     {
86         HxBlob2dFeature* feat = new HxBlob2dFeatureTem<T>(val);
87         _features[id] = feat;
88     }
```

8.3.3.7 template<class T> bool HxBlob2d::getFeature (HxString *name*, T & *val*) const [inline]

Get feature idetified by name from the list.

```
93     {
94         HxNameTable::sizeType id = _featNameTable.getId(name);
95         return getFeature(id, val);
96     }
```

8.3.3.8 template<class T> bool HxBlob2d::getFeature (HxNameTable::sizeType *id*, T & *val*) const [inline]

Get feature idetified by name from the list.

```
101     {
102         FeatureMap::const_iterator it = _features.find(id);
103         if (it == _features.end())
104             return false;
105         HxBlob2dFeature* base = (*it).second;
106         HxBlob2dFeatureTem<T>* featPtr =
107             dynamic_cast<HxBlob2dFeatureTem<T>* > (base);
108         if (featPtr == 0)
109             return false; // was other type
110         val = featPtr->getValue();
111         return true;
112     }
```

8.3.3.9 int HxBlob2d::getFeatureInt (HxString *name*) const

Wrapper around getFeature for int's.

```
144 {
145     int val;
146     getFeature(name, val);
147     return val;
148 }
```

8.3.3.10 HxValue HxBlob2d::getFeatureValue (HxString *name*) const

Wrapper around getFeature for **HxValue** (p. 1253)'s.

```
152 {
153     HxValue val;
154     getFeature(name, val);
155     return val;
156 }
```

8.3.3.11 STD_OSTREAM & HxBlob2d::put (STD_OSTREAM & *os*) const

Put blob on stream.

```
160 {
161     os << "Blob " << ident() << ", start: " << startMaer() << ", size: "
162        << sizeMaer() << STD_ENDL;
163     return os;
164 }
```

8.3.3.12 std::vector< HxString > HxBlob2d::getFeatureNames () [static]

Get all feature names.

```
168 {
169     return _featNameTable.getNames();
170 }
```

The documentation for this class was generated from the following files:

67 }
```

8.5.3.2 template<class ValT> ValT HxBlob2dFeatureTem< ValT >::getValue () const [inline]

Get the value of this tag.

```
72 {
73     return _value;
74 }
```

The documentation for this class was generated from the following file:

- **HxBlob2dFeatureTem.h**

8.6 HxBlob2dList Class Reference

A list of HxBlob2dPtr's, that is pointers to **HxBlob2d** (p. 402)'s.

`#include <HxBlob2dList.h>`

Public Types

- typedef std::back_insert_iterator< HxBlob2dList > **back_insert_iterator**
  back inserter.

8.6.1 Detailed Description

A list of HxBlob2dPtr's, that is pointers to **HxBlob2d** (p. 402)'s.

8.6.2 Member Typedef Documentation

8.6.2.1 typedef std::back_insert_iterator<HxBlob2dList> HxBlob2dList::back_insert_iterator

back inserter.

The documentation for this class was generated from the following file:

- **HxBlob2dList.h**

8.7 HxBlob2dPtrLess Struct Reference

Class definition for ordering of **HxBlob2d** (p. 402)* based on getLabel for use in STL containers.

`#include <HxBlob2d.h>`

Public Methods

- bool **operator()** (**HxBlob2d** *b1, **HxBlob2d** *b2) const

8.7.1 Detailed Description

Class definition for ordering of **HxBlob2d** (p. 402)∗ based on getLabel for use in STL containers.

The documentation for this struct was generated from the following file:

- **HxBlob2d.h**

8.8 HxBlob2dRelation Class Reference

A relation in a set of blobs in 2D.

`#include <HxBlob2dRelation.h>`

Public Methods

- **HxBlob2dRelation** ()
  Constructor.
- ∼**HxBlob2dRelation** ()
  Destructor.
- int **ident** () const
  The identifier of this relation.
- void **add** (**HxBlob2d** ∗blob, **HxBlob2dList** rels)
  Add a blob and its relations.
- **HxBlob2dListConstIter getBlobBegin** () const
  Get begin of the blobs.
- **HxBlob2dListConstIter getBlobEnd** () const
  Get end (STL term) of the blobs.
- **HxBlob2dList findRelatedBlobs** (**HxBlob2d** ∗blob)
  Find relations of given blob.
- **HxBlob2dListConstIter findRelatedBlobsBegin** (**HxBlob2d** ∗blob) const
  Get begin of related blobs list.
- **HxBlob2dListConstIter findRelatedBlobsEnd** (**HxBlob2d** ∗blob) const
  Get end (STL term) of related blobs list.
- **HxBlob2dListBackInserter findRelatedBlobsInserter** (**HxBlob2d** ∗blob)
  Get a backinserter for related blobs list.
- STD_OSTREAM & **put** (STD_OSTREAM &os) const
  Put relation on stream.

8.8.1 Detailed Description

A relation in a set of blobs in 2D.

Basically, for each blob a list ”related” blobs is stored.

8.8.2 Constructor & Destructor Documentation

8.8.2.1 HxBlob2dRelation::HxBlob2dRelation ()

Constructor.

```
16 {
17 }
```

8.8.2.2 HxBlob2dRelation::∼HxBlob2dRelation ()

Destructor.

```
20 {
21     // todo
22 }
```

8.8.3 Member Function Documentation

8.8.3.1 int HxBlob2dRelation::ident () const

The identifier of this relation.

8.8.3.2 void HxBlob2dRelation::add (HxBlob2d ∗ *blob*, HxBlob2dList *rels*)

Add a blob and its relations.

```
26 {
27     _head.push_back(blob);
28     _tail.push_back(rels);
29 }
```

8.8.3.3 HxBlob2dListConstIter HxBlob2dRelation::getBlobBegin () const

Get begin of the blobs.

```
33 {
34     return _head.begin();
35 }
```

8.8.3.4 HxBlob2dListConstIter HxBlob2dRelation::getBlobEnd () const

Get end (STL term) of the blobs.

```
39 {
40     return _head.end();
41 }
```

8.8.3.5 HxBlob2dList HxBlob2dRelation::findRelatedBlobs (HxBlob2d * *blob*)

Find relations of given blob.

```
45 {
46     for (int i=0 ; i<_head.size() ; i++)
47         if (_head[i] == blob)
48             return _tail[i];
49     return HxBlob2dList();
50 }
```

8.8.3.6 HxBlob2dListConstIter HxBlob2dRelation::findRelatedBlobsBegin (HxBlob2d * *blob*) const

Get begin of related blobs list.

```
54 {
55     for (int i=0 ; i<_head.size() ; i++)
56         if (_head[i] == blob)
57             return _tail[i].begin();
58     return HxBlob2dListConstIter();
59 }
```

8.8.3.7 HxBlob2dListConstIter HxBlob2dRelation::findRelatedBlobsEnd (HxBlob2d * *blob*) const

Get end (STL term) of related blobs list.

```
63 {
64     for (int i=0 ; i<_head.size() ; i++)
65         if (_head[i] == blob)
66             return _tail[i].end();
67     return HxBlob2dListConstIter();
68 }
```

8.8.3.8 HxBlob2dListBackInserter HxBlob2dRelation::findRelatedBlobsInserter (HxBlob2d * *blob*)

Get a backinserter for related blobs list.

```
72 {
73     for (int i=0 ; i<_head.size() ; i++)
74         if (_head[i] == blob)
75             return std::back_inserter(_tail[i]);
76     static HxBlob2dList dummyList;
77     return std::back_inserter(dummyList);
78 }
```

8.8.3.9 STD_OSTREAM & HxBlob2dRelation::put (STD_OSTREAM & *os*) const

Put relation on stream.

```
82 {
83     os << "Blob2dRelation " << STD_ENDL;
84     for(int i=0 ; i<_head.size() ; i++) {
85         os << "  blob " << _head[i]->ident() << " rels ";
86         for (HxBlob2dListConstIter b=_tail[i].begin() ;
87                                    b < _tail[i].end() ; b++)
88             os << (*b)->ident() << ", ";
89         os << STD_ENDL;
90     }
91     return os;
92 }
```

The documentation for this class was generated from the following files:

- **HxBlob2dRelation.h**
- HxBlob2dRelation.c

8.9 HxBoundingBox Class Reference

Definition of a bounding box.

`#include <HxBoundingBox.h>`

Public Methods

- **HxBoundingBox** (**HxPointZ** b, **HxPointZ** e)
  Constructor, begin and end point are included.
- **HxBoundingBox** (**HxSizes** s)
  Constructor.
- **HxPointZ begin** () const
  Begin point.
- **HxPointZ end** () const
  End point.
- **HxSizes size** () const
  Sizes.
- bool **isEmpty** () const
  Check validity.
- HxBoundingBox **unite** (const HxBoundingBox &arg) const
  Union of this and arg.
- HxBoundingBox **intersect** (const HxBoundingBox &arg) const

Intersection of this and arg.

- HxBoundingBox **extend** (**HxPointZ** p) const
  Extension of the box.
- HxBoundingBox **translate** (**HxPointZ** p) const
  Move the box.
- bool **includes** (**HxPointZ** p) const
  Check whether p is in the box.
- std::ostream & **put** (std::ostream &) const
  Put the box on the given stream.

8.9.1 Detailed Description

Definition of a bounding box.

Begin and end point are included in the box.

8.9.2 Constructor & Destructor Documentation

8.9.2.1 HxBoundingBox::HxBoundingBox (HxPointZ *b*, HxPointZ *e*)

Constructor, begin and end point are included.

```
14     : _isEmpty(false)
15 {
16     _begin = b.inf(e);
17     _end = b.sup(e);
18 }
```

8.9.2.2 HxBoundingBox::HxBoundingBox (HxSizes *s*)

Constructor.

```
21     : _isEmpty(false)
22 {
23     if (s.inf(HxSizes(1, 1, 1)) != HxSizes(1, 1, 1))
24     {
25         _isEmpty = true;
26         s = HxSizes(0, 0, 0);
27     }
28     _begin = HxPointZ(0, 0, 0);
29     _end = HxPointZ(s.x()-1, s.y()-1, s.z()-1);
30 }
```

8.9.3 Member Function Documentation

8.9.3.1 HxPointZ HxBoundingBox::begin () const [inline]

Begin point.

```
68 {
69     return _begin;
70 }
```

8.9.3.2 HxPointZ HxBoundingBox::end () const [inline]

End point.

```
74 {
75     return _end;
76 }
```

8.9.3.3 HxSizes HxBoundingBox::size () const

Sizes.

```
34 {
35     HxPointZ s = _end - _begin + HxPointZ(1, 1, 1);
36     return HxSizes(s.x(), s.y(), s.z());
37 }
```

8.9.3.4 bool HxBoundingBox::isEmpty () const [inline]

Check validity.

```
80 {
81     return _isEmpty;
82 }
```

8.9.3.5 HxBoundingBox HxBoundingBox::unite (const HxBoundingBox & *arg*) const

Union of this and arg.

```
41 {
42     return HxBoundingBox(_begin.inf(arg._begin), _end.sup(arg._end));
43 }
```

8.9.3.6 HxBoundingBox HxBoundingBox::intersect (const HxBoundingBox & *arg*) const

Intersection of this and arg.

```
47 {
48     HxPointZ b = _begin.sup(arg._begin);
49     HxPointZ e = _end.inf(arg._end);
50     if (b.inf(e) == b)
51         return HxBoundingBox(b, e);
52     return HxBoundingBox(HxSizes(0, 0, 0));
53 }
```

8.9.3.7 HxBoundingBox HxBoundingBox::extend (HxPointZ *p*) const

Extension of the box.

```
57 {
58     return HxBoundingBox(_begin.inf(p), _end.sup(p));
59 }
```

8.9.3.8 HxBoundingBox HxBoundingBox::translate (HxPointZ *p*) const

Move the box.

```
63 {
64     return HxBoundingBox(_begin + p, _end + p);
65 }
```

8.9.3.9 bool HxBoundingBox::includes (HxPointZ *p*) const

Check whether p is in the box.

```
69 {
70     return (    (p.x() > _begin.x()) &&
71                 (p.y() > _begin.y()) &&

73                 (p.x() < _end.x()) &&
74                 (p.y() < _end.y()) &&
75                 (p.z() < _end.z()) ) ? true : false;
76 }
```

8.9.3.10 std::ostream & HxBoundingBox::put (std::ostream & *os*) const

Put the box on the given stream.

```
80 {
81     if (_isEmpty)
82     {
83         return os << "empty";
84     }
85     else
86     {
87         return os << "{ " << _begin << ", " << _end << " }";
88     }
89 }
```

8.45 HxBSplineBasis Class Reference

Class definition for basis for BSpline curves.

`#include <HxBSplineBasis.h>`

Public Methods

- **HxBSplineBasis** ()

  Construct default basis.

- **HxBSplineBasis** (HxBSplineType typeCurve, int degree, int nIntervals, HxBSplineKnotsAlg typeKnots=uniformKnots, double minT=0.0, double maxT=1.0)

  Construct basis with uniformily distributed knots, given number of intervals, and path interval: minT <= t < maxT.

- **HxBSplineBasis** (HxBSplineType typeCurve, int degree, const std::vector< double > &knots)

  Construct basis with given knots.

- ~**HxBSplineBasis** ()

  Destructor.

- HxBSplineType **curveType** () const

  Get the type of the cuve.

- int **degree** () const

  Get the degree.

- int **nIntervals** () const

  Get the number of intervals.

- HxBSplineKnotsAlg **knotsType** () const

  Get the type of the knots generating algorithm.

- double **minT** () const

  Get the minimum value for t.

- double **maxT** () const

  Get the maximum value for t.

- double **knot** (int j) const

  Get the value of the given knot.

- std::vector< double > **allKnots** () const

  Get values of all knots.

- int **numB** () const

  Get the number of basis functions.

- double **B** (int index, double t) const

  Get value of given basis at path position t.

- double **dB** (int order, int index, double t) const

  Get derivative of given basis at path position t.

- **HxBSplineInterval pathAffectedBy** (int index) const

  Get path interval affected by given basis.

- HxBSplineBasis **insertKnot** (double t, int n=1) const

  Insert one knot at given position.

- STD_OSTREAM & **dump** (STD_OSTREAM &) const

  Dump the basis on the given stream.

- double **node** (int i) const
- int **maxBasis** (double t) const
- double **nearestKnot** (double t) const

Friends

- class **HxBSplineCurve**

8.45.1 Detailed Description

Class definition for basis for BSpline curves.

Based on ”Curve and Surface Fitting with Splines”, by ”Dierckx,P.”, ”Oxford”, ”1993”, chapter ”Univariate Splines”, and ”The NURBS book”, ”Piegl, L. and Tiller, W.”, Springer, 1997.

8.45.2 Constructor & Destructor Documentation

8.45.2.1 HxBSplineBasis::HxBSplineBasis ()

Construct default basis.

```
17 {
18     makeDefault();
19 }
```

8.45.2.2 HxBSplineBasis::HxBSplineBasis (HxBSplineType *t*, int *d*, int *n*, HxBSplineKnotsAlg *alg* = uniformKnots, double *min* = 0.0, double *max* = 1.0)

Construct basis with uniformily distributed knots, given number of intervals, and path interval: minT <= t < maxT.

```
32 {
33     _curveType = t;
34     _degree = d;
35     _minT = min;
36     _maxT = max;
37     _nIntervals = n;
38 
39     if ( _degree <= 0 || max <= min || _nIntervals < 1 ||
40          ( t==closed && _nIntervals <= d ) ||
41          alg != uniformKnots ) {
42         message("(constructor) invalid parameters - using default");
43         makeDefault();
44         return;
45     }
46             // parameters ok
47     _knotsType = uniformKnots;
48     vector<double> knots = makeUniformKnots();
49     completeKnots(knots);
50 }
```

8.45.2.3 HxBSplineBasis::HxBSplineBasis (HxBSplineType *typeCurve*, int *degree*, const std::vector< double > & *knots*)

Construct basis with given knots.

The number of intervals and path are determined from the given knots.

8.45.2.4 HxBSplineBasis::~HxBSplineBasis ()

Destructor.

```
89 {
90 }
```

8.45.3 Member Function Documentation

8.45.3.1 HxBSplineType HxBSplineBasis::curveType () const [inline]

Get the type of the cuve.

```
156 {
157     return _curveType;
158 }
```

8.45.3.2 int HxBSplineBasis::degree () const [inline]

Get the degree.

```
162 {
163     return _degree;
164 }
```

8.45.3.3 int HxBSplineBasis::nIntervals () const [inline]

Get the number of intervals.

```
169 {
170     return _nIntervals;
171 }
```

8.45.3.4 HxBSplineKnotsAlg HxBSplineBasis::knotsType () const [inline]

Get the type of the knots generating algorithm.

```
175 {
176     return _knotsType;
177 }
```

8.45.3.5 double HxBSplineBasis::minT () const [inline]

Get the minimum value for t.

```
181 {
182     return _minT;
183 }
```

8.45.3.6 double HxBSplineBasis::maxT () const [inline]

Get the maximum value for t.

```
187 {
188     return _maxT;
189 }
```

8.45.3.7 double HxBSplineBasis::knot (int *i*) const [inline]

Get the value of the given knot.

```
208 {
209     return _knotsVec[i];
210 }
```

8.45.3.8 vector< double > HxBSplineBasis::allKnots () const [inline]

Get values of all knots.

```
214 {
215     return _knotsVec;
216 }
```

8.45.3.9 int HxBSplineBasis::numB () const [inline]

Get the number of basis functions.

```
193 {
194     switch ( curveType() ) {
195       case closed:
196            return _nIntervals;
197            break;
198       case openRepeatEndPoints:
199       case open:
200       default:  // this case should never happen!
201            return _nIntervals+degree();
202            break;
203     }
204 }
```

8.45.3.10 double HxBSplineBasis::B (int *i*, double *t*) const

Get value of given basis at path position t.

```
102 {

8.46 HxBSplineCurve Class Reference

Class definition for BSpline curves.

`#include <HxBSplineCurve.h>`

Public Methods

- **HxBSplineCurve** ()

  Construct default curve.

- **HxBSplineCurve** (const **HxBSplineBasis** &basis, const HxPointSetR2 &cp)

  Construct a curve with given basis and control points.

- ~**HxBSplineCurve** ()

  Destructor.

- int **ident** () const

  Get the identifier.

- **HxBSplineBasis basis** () const

  Get the basis.

- HxBSplineType **curveType** () const

  Get the curve type.

- int **degree** () const

  Get the degree of the curve.

- double **minT** () const

  Get the minimum value of T.

- double **maxT** () const

  Get the maximum value of T.

- **HxBSplineInterval getInterval** (double t1, double t2) const

  Get the curve interval determined by t1, t2.

- int **numP** () const

  Get the number of control points.

- **HxPointR2 P** (int i) const

  Get the coordinates of control point i.

- HxPointSetR2 **allP** () const

  Get the coordinates of all control points.

- **HxPolyline2d controlP** () const

  Get the control polygon.

- double **B** (int i, double t) const

  Get the value of basis i at path position t.

- double **dB** (int order, int i, double t) const

  Get derivative of basis i at path position t.

- **HxBSplineInterval pathAffectedBy** (int index) const

  Get the curve interval affected by given control point.

- vector< int > **PThatAffectCAt** (double t) const

  Get the indices of control points that affect the curve at path position t.

- vector< int > **PThatAffectCAt** (const **HxBSplineInterval** &interval) const

  Get the indices of control points that affect the curve inside given interval.

- **HxPointR2 C** (double t) const

  Get the curve point at path position t.

- **HxVectorR2 dC** (int order, double t) const

  Get the curve derivative at path position t.

- double **kAtC** (double t) const

  Get curvature at path position t.

- double **dTurnAngleAtC** (double t) const

  Get derivative of turning angle at path position t.

- double **length** (int n=50) const

  Get the total curve length based on distance between the given number of samples (n).

- double **length** (const **HxBSplineInterval** &interval, int n=50) const

  Get the length of the given curve interval.

- **HxPointR2 center** () const

  Get the center of control polygon.

- **HxPolyline2d sampleC** (int n=50) const

  Sample the curve at n points.

- HxBSplineCurve **changeAllP** (const HxPointSetR2 &p) const

  Replace the coordinates of all control points.

- HxBSplineCurve **translateAllP** (const **HxVectorR2** &v) const

  Translate all control points.

- HxBSplineCurve **scaleAllP** (double s) const

  Scale control polygon using center as origin.

- HxBSplineCurve **translateCurve** (const **HxVectorR2** &v, double t) const

  Translate the given point in the curve in the given direction modifying only one control point (NURBS book p.511-513).

- HxBSplineCurve **translateCurve** (const **HxPointR2** &pDest, double t) const

  Translate the given point in the curve to the given position modifying only one control point (NURBS book p.511-513).

- HxBSplineCurve **translateCurve2** (const **HxVectorR2** &v, double t) const

  Translate the given point in the curve to the given position modifying two control points (NURBS book p.511-513).

- HxBSplineCurve **insertKnot** (double t, int n=1) const

  Insert a given number of knots in the curve with corresponding control point without changing parametrization and geometry.

- STD_OSTREAM & **dump** (STD_OSTREAM &) const

  Dump the curve on the given stream.

Static Public Methods

- HxBSplineCurve **makeUniform** (**HxPolyline2d** cp, int degree)

  Make a curve with uniform knots.

- HxBSplineCurve **makeInterpolating** (**HxPolyline2d** cp)

  Make an interpolating curve (uniform knots).

8.46.1 Detailed Description

Class definition for BSpline curves.

Based on ”Curve and Surface Fitting with Splines”, by ”Dierckx,P.”, ”Oxford”, ”1993”, chapter ”Univariate Splines”, and ”The NURBS book”, ”Piegl, L. and Tiller, W.”, Springer, 1997.

8.46.2 Constructor & Destructor Documentation

8.46.2.1 HxBSplineCurve::HxBSplineCurve ()

Construct default curve.

```
21 {
22     _ident = _nr++;
23     makeDefault();
24 }
```

8.46.2.2 HxBSplineCurve::HxBSplineCurve (const HxBSplineBasis & *basis*, const HxPointSetR2 & *vectorOfCP*)

Construct a curve with given basis and control points.

```
27                                      : _basis(basis)
28 {
29     _ident = _nr++;
30     if ( vectorOfCP.size() != numP() ) {
31         message("(constructor) invalid number of control points - making default");
32         makeDefault();
33     }
34     else
35         _PVec = vectorOfCP;
36 }
```

8.46.2.3 HxBSplineCurve::∼HxBSplineCurve ()

Destructor.

```
64 {
65 }
```

8.46.3 Member Function Documentation

8.46.3.1 HxBSplineCurve HxBSplineCurve::makeUniform (HxPolyline2d *cp*, int *degree*) [static]

Make a curve with uniform knots.

```
40 {
41     HxBSplineType type = (cp.getClosed())? closed : openRepeatEndPoints;
42     HxPointSetR2 p = cp.getPoints();
43
```

```
44     int nInt;
45     if (cp.getClosed())
46         nInt = p.size();
47     else
48         nInt = p.size() - degree;
49
50     HxBSplineBasis base(type, degree, nInt, uniformKnots, 0, 1);
51     return HxBSplineCurve(base, p);
52 }
```

8.46.3.2 HxBSplineCurve HxBSplineCurve::makeInterpolating (HxPolyline2d *cp*) [static]

Make an interpolating curve (uniform knots).

```
56 {
57     HxLocalInterpol interpol(3, cp.getPoints(), cp.getClosed());
58     HxBSplineType type = (cp.getClosed())? closed : open;
59     HxBSplineBasis base(type, 3, interpol.allKnots());
60     return HxBSplineCurve(base, interpol.allP());
61 }
```

8.46.3.3 int HxBSplineCurve::ident () const [inline]

Get the identifier.

```
200 {
201     return _ident;
202 }
```

8.46.3.4 HxBSplineBasis HxBSplineCurve::basis () const [inline]

Get the basis.

```
206 {
207     return _basis;
208 }
```

8.46.3.5 HxBSplineType HxBSplineCurve::curveType () const [inline]

Get the curve type.

```
212 {
213     return _basis.curveType();
214 }
```

8.46.3.6 int HxBSplineCurve::degree () const [inline]

Get the degree of the curve.

```
218 {
219     return _basis.degree();
220 }
```

8.46.3.7 double HxBSplineCurve::minT () const [inline]

Get the minimum value of T.

```
224 {
225     return _basis.minT();
226 }
```

8.46.3.8 double HxBSplineCurve::maxT () const [inline]

Get the maximum value of T.

```
230 {
231     return _basis.maxT();
232 }
```

8.46.3.9 HxBSplineInterval HxBSplineCurve::getInterval (double *t1*, double *t2*) const [inline]

Get the curve interval determined by t1, t2.

```
236 {
237     return HxBSplineInterval(t1, t2,
238         _basis.minT(), _basis.maxT(), _basis.curveType());
239 }
```

8.46.3.10 int HxBSplineCurve::numP () const [inline]

Get the number of control points.

```
261 {
262     return _basis.numB();
263 }
```

8.46.3.11 HxPointR2 HxBSplineCurve::P (int *i*) const [inline]

Get the coordinates of control point i.

```
267 {
268     if ( i < 0 || i >= numP() ) {
269         message("(P) invalid index - setting to 0");
270         i = 0;
271     }
272     return _PVec[i];
273 }
```

8.46.3.12 HxPointSetR2 HxBSplineCurve::allP () const [inline]

Get the coordinates of all control points.

```
277 {
278     return _PVec;
279 }
```

8.46.3.13 HxPolyline2d HxBSplineCurve::controlP () const [inline]

Get the control polygon.

```
283 {
284     return HxPolyline2d(_PVec, (curveType() == closed));
285 }
```

8.46.3.14 double HxBSplineCurve::B (int *i*, double *t*) const [inline]

Get the value of basis i at path position t.

```
243 {
244     return _basis.B(i, t);
245 }
```

8.46.3.15 double HxBSplineCurve::dB (int *order*, int *i*, double *t*) const [inline]

Get derivative of basis i at path position t.

```
249 {
250     return _basis.dB(order, i, t);
251 }
```

8.46.3.16 HxBSplineInterval HxBSplineCurve::pathAffectedBy (int *index*) const [inline]

Get the curve interval affected by given control point.

```
255 {
256     return _basis.pathAffectedBy(index);
257 }
```

8.46.3.17 vector< int > HxBSplineCurve::PThatAffectCAt (double *t*) const

Get the indices of control points that affect the curve at path position t.

```
73 {
74     if ( t < minT() ) {
75         message("(PThatAffectCAt) invalid t - setting to minT()");
76         t = minT();
77     }
78     if ( t >= maxT() ) {
79         message("(PThatAffectCAt) invalid t - setting near to maxT()");
80         t = maxT() - EPS;
81     }
82
83     vector<int> b;
84     int index = _basis.whichInterval(t);
85     for ( int i=index; i <= index + degree(); i++)
86         b.push_back(indexPVec(i));
87
88     return b;
89 }
```

8.46.3.18 vector< int > HxBSplineCurve::PThatAffectCAt (const HxBSplineInterval & *interval*) const

Get the indices of control points that affect the curve inside given interval.

```
97 {
98     int i = indexPVec(_basis.whichInterval(interval.begin()));
99     int f = indexPVec(_basis.whichInterval(interval.end()) + degree());
100
101     vector<int> b;
102     while (i != f) {
103         b.push_back(indexPVec(i));
104         if ( ++i >= numP() )
105             i = 0;      // wrap closed curve
106     };
107     b.push_back(indexPVec(f));
108     return b;
109 }
```

8.46.3.19 HxPointR2 HxBSplineCurve::C (double *t*) const [inline]

Get the curve point at path position t.

```
295 {
296     HxVectorR2 tmp = dC( 0, t);
297     return HxPointR2(tmp.x(), tmp.y());
298 }
```

8.46.3.20 HxVectorR2 HxBSplineCurve::dC (int *order*, double *t*) const

Get the curve derivative at path position t.

```
121 {
122     if ( t < minT() ) {
123         message("(dC) invalid t - setting to minT()");
124         t = minT();

8.47 HxBSplineInterval Class Reference

Class definition for HxBSplineInterval to facilitate manipulation of path intervals in open and closed curves.

`#include <HxBSplineInterval.h>`

Public Methods

- **HxBSplineInterval** ()

  Default constructor.

- **HxBSplineInterval** (double b, double e, double min, double max, HxBSplineType type)

  Construct interval [b,e) in a curve with total path from [min,max) and given type.

- **HxBSplineInterval** (double b, double e, double min, double max, int closed)

Construct interval [b,e) in a curve with total path from [min,max) and given type.

- ~**HxBSplineInterval** ()
  Destructor.
- double **begin** () const
  first t in interval.
- double **end** () const
  last t in interval.
- int **contains** (double t) const
  Determine if the path parameter t is inside this interval.
- double **next** (double t, double delta) const
  returns t+delta, with wrapping for closed intervals.
- double **prev** (double t, double delta) const
  returns t-delta, with wrapping for closed intervals.
- double **length** () const
  path lenght of interval.
- double **middle** () const
  middle t of interval.
- double **ratio** (double r) const
  t corresponding to given proportion of interval.
- int **isClosed** () const
  1 if interval is wrapped.
- HxBSplineInterval **cropBegin** (double t) const
  cut begin of interval: [t,e).
- HxBSplineInterval **cropEnd** (double t) const
  cut end of interval: [b,t).
- HxBSplineInterval **part** (double t1, double t2) const
  get subinterval [t1,t2).

8.47.1 Detailed Description

Class definition for HxBSplineInterval to facilitate manipulation of path intervals in open and closed curves.

path interval (oriented). interval = [first, second). For open paths, first < second (always). For closed paths, first > second indicates wrap around t=min, max.

8.47.2 Constructor & Destructor Documentation

8.47.2.1 HxBSplineInterval::HxBSplineInterval () [inline]

Default constructor.

```
99                                          : pair<double,double>()
100 {
101     _min = 0;
102     _max = 0;
103     _wrap = 0;
104 }
```

8.47.2.2 HxBSplineInterval::HxBSplineInterval (double *b*, double *e*, double *min*, double *max*, HxBSplineType *type*) [inline]

Construct interval [b,e) in a curve with total path from [min,max) and given type.

```
109     : pair<double,double>(b,e)
110 {
111     _min = min;
112     _max = max;
113     _wrap = (type == closed);
114 }
```

8.47.2.3 HxBSplineInterval::HxBSplineInterval (double *b*, double *e*, double *min*, double *max*, int *wrap*) [inline]

Construct interval [b,e) in a curve with total path from [min,max) and given type.

```
119     : pair<double,double>(b,e)
120 {
121     _min = min;
122     _max = max;
123     _wrap = wrap;
124 }
```

8.47.2.4 HxBSplineInterval::~HxBSplineInterval () [inline]

Destructor.

```
128 {
129 }
```

8.47.3 Member Function Documentation

8.47.3.1 double HxBSplineInterval::begin () const [inline]

first t in interval.

```
133 {
134     return first;
135 }
```

8.47.3.2 double HxBSplineInterval::end () const [inline]

last t in interval.

```
139 {
140     return second;
141 }
```

8.47.3.3 int HxBSplineInterval::contains (double *t*) const [inline]

Determine if the path parameter t is inside this interval.

Consider wrapping for closed curves. interval = [first, second)

```
145 {
146     if ( first == second )      // special case?
147         return (t >= _min && t < _max);
148     if ( first > second )       // is wrapped?
149         return (t >= first && t < _max) || (t >= _min && t < second);
150     else    return (t >= first && t < second);
151 }
```

8.47.3.4 double HxBSplineInterval::next (double *t*, double *delta*) const [inline]

returns t+delta, with wrapping for closed intervals.

```
155 {
156     t += delta;
157     if ( t >= _max && _wrap )
158         t = _min + (t - _max);
159     return t;
160 }
```

8.47.3.5 double HxBSplineInterval::prev (double *t*, double *delta*) const [inline]

returns t-delta, with wrapping for closed intervals.

```
164 {
165     t -= delta;
166     if ( t <  _min && _wrap )
167         t = _max - (_min - t);
168     return t;
169 }
```

8.47.3.6 double HxBSplineInterval::length () const [inline]

path lenght of interval.

```
173 {
174     double tmp = second - first;
175     if ( tmp < 0 && _wrap )
```

```
176         return (_max - EPS - first) + (second - _min);
177     else    if ( tmp < EPS )
178             return EPS;
179         else    return tmp - EPS;
180 }
```

8.47.3.7 double HxBSplineInterval::middle () const [inline]

middle t of interval.

```
184 {
185     return ratio(0.5);
186 }
```

8.47.3.8 double HxBSplineInterval::ratio (double *r*) const [inline]

t corresponding to given proportion of interval.

```
190 {
191     double t = length() * r + first;
192     if ( t >= _max )
193         t = _min + (t - _max);
194     return t;
195 }
```

8.47.3.9 int HxBSplineInterval::isClosed () const [inline]

1 if interval is wrapped.

```
199 {
200     return _wrap;
201 }
```

8.47.3.10 HxBSplineInterval HxBSplineInterval::cropBegin (double *t*) const [inline]

cut begin of interval: [t,e).

```
205 {
206     HxBSplineInterval tmp(t, second, _min, _max, _wrap);
207     return tmp;
208 }
```

8.47.3.11 HxBSplineInterval HxBSplineInterval::cropEnd (double *t*) const [inline]

cut end of interval: [b,t).

```
212 {
213     HxBSplineInterval tmp(first, t, _min, _max, _wrap);
214     return tmp;
215 }
```

8.47.3.12 HxBSplineInterval HxBSplineInterval::part (double *t1*, double *t2*) const [inline]

get subinterval [t1,t2).

```
219 {
220     HxBSplineInterval tmp(t1, t2, _min, _max, closed);
221     tmp._wrap = _wrap;
222     return tmp;
223 }
```

- **HxBSplineInterval.h**

8.48 HxClassName Struct Template Reference

Class to convert a static type (i.e.

`#include <HxClassName.h>`

Public Methods

- **operator HxString** ()
  Convert to string.

8.48.1 Detailed Description

template<class Type> struct HxClassName< Type >

Class to convert a static type (i.e.

Type) to a string by calling Type::className(). Contains template specializations for types that do not have className(), e.g. builtin types.

8.48.2 Member Function Documentation

8.48.2.1 template<class Type> HxClassName< Type >::operator HxString () [inline]

Convert to string.

```
33 {
34     return Type::className();
35 }
```

The documentation for this struct was generated from the following file:

  to Luv.
- HxColor **toOOO** () const
  to OOO.
- HxColor **toHSI** () const
  to HSI.
- int **operator==** (const HxColor &v) const
  Equal.
- int **operator!=** (const HxColor &v) const
  Not equal.
- STD_OSTREAM & **put** (STD_OSTREAM &os) const
  Print color on stream.
- **HxString toString** () const
  Color as a string.

8.50.1 Detailed Description

Class definition color semantics.

8.50.2 Constructor & Destructor Documentation

8.50.2.1 HxColor::HxColor () [inline]

Default constructor.

```
102     : _value(0,0,0), _space(RGB)
103 {
104 }
```

8.50.2.2 HxColor::HxColor (HxVec3Double *color*, HxColorModel *space* = RGB) [inline]

Construction from given color in color space.

```
108     : _value(color), _space(space)
109 {
110 }
```

8.50.2.3 HxColor::HxColor (const HxColor & *rhs*) [inline]

Copy constructor.

```
114     : _value(rhs._value), _space(rhs._space)
115 {
116 }
```

8.50.3 Member Function Documentation

8.50.3.1 HxColor & HxColor::operator= (const HxColor & *rhs*) [inline]

Assignment operator.

```
120 {
121     _value = rhs._value;
122     _space = rhs._space;
123     return *this;
124 }
```

8.50.3.2 const HxVec3Double & HxColor::value () const [inline]

Return the value.

```
128 {
129     return _value;
130 }
```

8.50.3.3 HxColor HxColor::convert (const HxColorModel *space*) const [inline]

General color space convertor.

See also : **Color operations on pixel values** (p. 6).

```
134 {
135     switch (space) {
136     case RGB: return toRGB();
137     case CMY: return toCMY();
138     case XYZ: return toXYZ();
139     case Lab: return toLab();
140     case Luv: return toLuv();
141     case OOO: return toOOO();
142     case HSI: return toHSI();
143     }
144     return HxColor();
145 }
```

8.50.3.4 HxColor HxColor::toRGB () const

to RGB.

```
50 {
51     switch (_space) {
52     case RGB:
53         return *this;
54     case CMY:
55         return HxColor(HxColCMY2RGB(_value), RGB);
56     case XYZ:
57         return HxColor(HxColXYZ2RGB(_value), RGB);
58     case Lab: {
59         HxVec3Double xyz = HxColLab2XYZ(_value);
60         return HxColor(HxColXYZ2RGB(xyz), RGB);
61       }
62     case Luv: {
63         HxVec3Double xyz = HxColLuv2XYZ(_value);
64         return HxColor(HxColXYZ2RGB(xyz), RGB);

8.51 HxComplex Class Reference

Class definition complex.

`#include <HxComplex.h>`

Constructors

- **HxComplex** ()

  Default constructor.

- **HxComplex** (double re, double im)

  Conversion from native type.

- **HxComplex** (const HxComplex &rhs)

  Copy constructor.

Inquiry

- int **dim** () const

  Dimensionality.

- double **x** () const

  Real Value.

- double **y** () const

  Imaginary Value.

- double **getValue** (int dimension) const
  Element in given dimension.
- void **setValue** (int dimension, double value)

Conversion

- **operator HxScalarInt** () const
  Cast to **HxScalarInt** (p. 1164).
- **operator HxScalarDouble** () const
  Cast to **HxScalarDouble** (p. 1145).
- **operator HxVec2Int** () const
  Cast to **HxVec2Int** (p. 1281).
- **operator HxVec2Double** () const
  Cast to **HxVec2Double** (p. 1262).
- **operator HxVec3Int** () const
  Cast to **HxVec3Int** (p. 1321).
- **operator HxVec3Double** () const
  Cast to **HxVec3Double** (p. 1301).

Operators

Mathematical definition: **Binary operations on pixel values** (p. 5)

- int **operator==** (const HxComplex &v) const
  Equal.
- int **operator!=** (const HxComplex &v) const
  Not equal.
- int **operator**< (const HxComplex &v) const
  Less than.
- int **operator**<= (const HxComplex &v) const
  Less equal.
- int **operator**> (const HxComplex &v) const
  Greater than.
- int **operator**>= (const HxComplex &v) const
  Greater equal.
- const HxComplex **SMALL_VAL** = HxComplex(0, 0)

A small value w.r.t to the comparison operators "<" and ">".

- const HxComplex **LARGE_VAL** = HxComplex(1e300, 1e300)
  A large value w.r.t to the comparison operators "<" and ">".

Unary operations

Mathematical definition: **Unary operations on pixel values** (p. 4)

- HxComplex **operator-** () const
  Negation.
- HxComplex **complement** () const
  Complement.
- HxComplex **conjugate** () const
  Conjugate.
- **HxScalarDouble abs** () const
  Absolute value.
- **HxScalarDouble arg** () const
  Argument.
- HxComplex **ceil** () const
  Ceiling.
- HxComplex **floor** () const
  Floor.
- HxComplex **round** () const
  Round.
- HxComplex **sum** () const
  Sum.
- HxComplex **product** () const
  Product.
- **HxScalarDouble min** () const
  Minimum.
- **HxScalarDouble max** () const
  Maximum.
- **HxScalarDouble norm1** () const
  L1 norm.
- **HxScalarDouble norm2** () const

L2 norm.

- **HxScalarDouble normInf** () const
  L infinity norm.
- HxComplex **sqrt** () const
  Square root.
- HxComplex **sin** () const
  Sine.
- HxComplex **cos** () const
  Cosine.
- HxComplex **tan** () const
  Tangent.
- HxComplex **asin** () const
  Arc sine.
- HxComplex **acos** () const
  Arc cosine.
- HxComplex **atan** () const
  Arc tangent.
- HxComplex **atan2** () const
  Arc tangent.
- HxComplex **sinh** () const
  Hyperbolic sine.
- HxComplex **cosh** () const
  Hyperbolic cosine.
- HxComplex **tanh** () const
  Hyperbolic tangent.
- HxComplex **exp** () const
  Exponent.
- HxComplex **log** () const
  Natural logarithm.
- HxComplex **log10** () const
  Base 10 logarithm.

Binary operations

Mathematical definition: **Binary operations on pixel values** (p. 5)

- HxComplex & **operator+=** (const HxComplex &v)
  Addition and assignment.
- HxComplex & **operator-=** (const HxComplex &v)
  Subtraction and assignment.
- HxComplex & **operator** $*$**=** (const HxComplex &v)
  Multiplication and assignment.
- HxComplex & **operator/=** (const HxComplex &v)
  Division and assignment.
- HxComplex **min** (const HxComplex &v) const
  Minimum.
- HxComplex & **minAssign** (const HxComplex &v)
  Minimum and assignment.
- HxComplex **max** (const HxComplex &v) const
  Maximum.
- HxComplex & **maxAssign** (const HxComplex &v)
  Maximum and assignment.
- HxComplex **inf** (const HxComplex &v) const
  Infimum.
- HxComplex & **infAssign** (const HxComplex &v)
  Infimum and assignment.
- HxComplex **sup** (const HxComplex &v) const
  Supremum.
- HxComplex & **supAssign** (const HxComplex &v)
  Supremum and assignment.
- HxComplex **pow** (const HxComplex &v) const
  Power.
- HxComplex **mod** (const HxComplex &v) const
  Modulo.
- HxComplex **and** (const HxComplex &v) const
  And.
- HxComplex **or** (const HxComplex &v) const

Or.

- HxComplex **xor** (const HxComplex &v) const
  Xor.
- HxComplex **leftShift** (const HxComplex &v) const
  Left shift.
- HxComplex **rightShift** (const HxComplex &v) const
  Right shift.
- **HxScalarDouble dot** (const HxComplex &v) const
  Dot product.
- HxComplex **cross** (const HxComplex &v) const
  Cross product.
- HxComplex **operator+** (const HxComplex &v1, const HxComplex &v2)
  Addition.
- HxComplex **operator-** (const HxComplex &v1, const HxComplex &v2)
  Subtraction.
- HxComplex **operator** $*$ (const HxComplex &v1, const HxComplex &v2)
  Multiplication.
- HxComplex **operator/** (const HxComplex &v1, const HxComplex &v2)
  Division.

Output

- STD_OSTREAM & **put** (STD_OSTREAM &os) const
  Print value on stream.
- **HxString toString** () const
  Value as a string.

Public Methods

- void $*$ **operator new** (size_t, void $*$=0)
- HxComplex & **operator=** (const HxComplex &rhs)

8.51.1 Detailed Description

Class definition complex.

8.51.2 Constructor & Destructor Documentation

8.51.2.1 HxComplex::HxComplex () [inline]

Default constructor.

```
330 {
331 }
```

8.51.2.2 HxComplex::HxComplex (double *re*, double *im*) [inline]

Conversion from native type.

```
335 {
336     _values[0] = re;
337     _values[1] = im;
338 }
```

8.51.2.3 HxComplex::HxComplex (const HxComplex & *v*) [inline]

Copy constructor.

```
342 {
343     _values[0] = v._values[0];
344     _values[1] = v._values[1];
345 }
```

8.51.3 Member Function Documentation

8.51.3.1 int HxComplex::dim () const [inline]

Dimensionality.

```
363 {
364     return 2;
365 }
```

8.51.3.2 double HxComplex::x () const [inline]

Real Value.

```
369 {
370     return _values[0];
371 }
```

8.51.3.3 double HxComplex::y () const [inline]

Imaginary Value.

```
375 {
376     return _values[1];
377 }
```

8.51.3.4 double HxComplex::getValue (int *dim*) const [inline]

Element in given dimension.

```
381 {
382     return _values[dim - 1];
383 }
```

8.51.3.5 HxComplex::operator HxScalarInt () const

Cast to **HxScalarInt** (p. 1164).

```
27 {
28     return (int) _values[0];
29 }
```

8.51.3.6 HxComplex::operator HxScalarDouble () const

Cast to **HxScalarDouble** (p. 1145).

```
32 {
33     return _values[0];
34 }
```

8.51.3.7 HxComplex::operator HxVec2Int () const

Cast to **HxVec2Int** (p. 1281).

```
37 {
38     return HxVec2Int(int(_values[0]), int(_values[1]));
39 }
```

8.51.3.8 HxComplex::operator HxVec2Double () const

Cast to **HxVec2Double** (p. 1262).

```
42 {
43     return HxVec2Int(_values[0], _values[1]);
44 }
```

8.51.3.9 HxComplex::operator HxVec3Int () const

Cast to **HxVec3Int** (p. 1321).

```
47 {
48     return HxVec3Int(int(_values[0]), int(_values[1]), 0);
49 }
```

8.51.3.10 HxComplex::operator HxVec3Double () const

Cast to **HxVec3Double** (p. 1301).

```
52 {
53     return HxVec3Double(_values[0], _values[1], 0);
54 }
```

8.51.3.11 int HxComplex::operator== (const HxComplex & *v*) const [inline]

Equal.

```
393 {
394     return (_values[0] == v._values[0]) && (_values[1] == v._values[1]);
395 }
```

8.51.3.12 int HxComplex::operator!= (const HxComplex & *v*) const [inline]

Not equal.

```
399 {

```

8.51.5 Member Data Documentation

8.51.5.1 const HxComplex HxComplex::SMALL_VAL = HxComplex(0, 0) [static]

A small value w.r.t to the comparison operators "<" and ">".

Not actually the minimum to avoid overflow.

8.51.5.2 const HxComplex HxComplex::LARGE_VAL = HxComplex(1e300, 1e300) [static]

A large value w.r.t to the comparison operators "<" and ">".

Not actually the maximum to avoid overflow.

The documentation for this class was generated from the following files:

- **HxComplex.h**
- HxComplex.c

8.52 HxCoord Struct Reference

Representation for integer coordinates (x,y,z).

`#include <HxCnum.h>`

Public Attributes

- int **x**
- int **y**
- int **z**

8.52.1 Detailed Description

Representation for integer coordinates (x,y,z).

The documentation for this struct was generated from the following file:

8.55.1 Detailed Description

template<class PixelT, class ArithT> class HxDataPtr3dScalarTem< PixelT, ArithT >

Template class for data pointers to 3D images with scalar values.

The documentation for this class was generated from the following files:

- **HxDataPtr3dScalarTem.h**
- HxDataPtr3dScalarTem.c

8.56 HxDiyTranspose Class Template Reference

Functor for transpose.

Public Methods

- **HxDiyTranspose** (**HxTagList** &)
  Constructor : empty.
- void **doIt** (DstDataPtrT dstPtr, SrcDataPtrT srcPtr, **HxSizes** dstSize, **HxSizes** srcSize)
  Actual operation.

Static Public Methods

- **HxString className** ()
  The name : "transpose".

8.56.1 Detailed Description

template<class DstDataPtrT, class SrcDataPtrT> class HxDiyTranspose< DstDataPtrT, SrcDataPtrT >

Functor for transpose.

8.56.2 Constructor & Destructor Documentation

8.56.2.1 template<class DstDataPtrT, class SrcDataPtrT> HxDiyTranspose< DstDataPtrT, SrcDataPtrT >::HxDiyTranspose (HxTagList &) [inline]

Constructor : empty.

```
28                          {}
```

8.56.3 Member Function Documentation

8.56.3.1 template<class DstDataPtrType, class SrcDataPtrType> void HxDiyTranspose< DstDataPtrType, SrcDataPtrType >::doIt (DstDataPtrType *dstPtr*, SrcDataPtrType *srcPtr*, HxSizes *dstSize*, HxSizes *srcSize*)

Actual operation.

```
56 {
57     // write size check!
58     int y = dstSize.x();
59     while (--y >= 0) {
60         HxTranspose_Line(dstPtr, srcPtr, dstSize.y());
61         srcPtr.incY();
62         dstPtr.incX();
63     }
64 }
```

8.56.3.2 template<class DstDataPtrT, class SrcDataPtrT> HxString HxDiyTranspose< DstDataPtrT, SrcDataPtrT >::className () [inline, static]

The name : ”transpose”.

```
36                          { return HxString("transpose"); }
```

The documentation for this class was generated from the following file:

8.57 HxExportExtraIdentMaskCentralMoments Class Template Reference

Functor for computation of the central moments up to order N of all values in an image identified by a mask.

`#include <HxExportExtraIdentMaskCentralMoments.h>`

Public Types

- typedef **HxTagTransVar TransVarianceCategory**

  Functor is translation variant.

- typedef **HxTagNPhase PhaseCategory**

  N phases.

Public Methods

- **HxExportExtraIdentMaskCentralMoments** (**HxTagList** &tags)

  Constructor.

- ~**HxExportExtraIdentMaskCentralMoments** ()

  Destructor.

- int **nrPhases** () const

  The number of phases.

- void **init** (int phase)

  Start of given phase.

- void **doIt** (const ImValT &imV, const ExtraValT &extraV, int x, int y, int z)

  Processing one pixel.

- void **done** (int phase)

  End of given phase.

Static Public Methods

- **HxString className** ()

  The name : "identMaskCentralMoments".

8.57.1 Detailed Description

template<class ResultT, class ImValT, class ExtraValT> class HxExportExtraIdentMaskCentralMoments< ResultT, ImValT, ExtraValT >

Functor for computation of the central moments up to order N of all values in an image identified by a mask.

```
*  Upq = Sum[ (x - xBar)^p * (y - yBar)^q * f(x,y) ]
*         x,y
*
*  with xBar = M10 / M00 (moments!)
*  and  yBar = M01 / M00 (moments!)
*  M00 = Sum [f(x,y)], M10 = Sum [x * f(x,y)], M01 = Sum [y * f(x,y)]
*
*  The order in the resulting list is determined by:
*
*  for (int q=0 ; q<=N ; q++)
*      for (int p=0 ; p<=N ; p++)
```

```
*          if (p+q <= N)
*              [Upq];
*
*  For N=1 the order is: U00, U10, U01
*  For N=2 the order is: U00, U10, U20, U01, U11, U02
*  For N=3 the order is: U00, U10, U20, U30, U01, U11, U21, U02, U12, U03.
*
```

8.57.2 Member Typedef Documentation

8.61 HxExportExtraIdentMaskStdev Class Template Reference

Functor for computation of the standard deviation of all values in an image identified by a mask.

`#include <HxExportExtraIdentMaskStdev.h>`

Public Types

- typedef **HxTagTransInVar TransVarianceCategory**

  Functor is translation invariant.

- typedef **HxTag1Phase PhaseCategory**

  1 phase.

Public Methods

- **HxExportExtraIdentMaskStdev** (**HxTagList** &tags)

  Constructor.

- ~**HxExportExtraIdentMaskStdev** ()

  Destructor.

- void **doIt** (const ImValT &imV, const ExtraValT &extraV)

  Processing one pixel.

Static Public Methods

- **HxString className** ()

  The name : "identMaskStdev".

8.61.1 Detailed Description

template<class ResultT, class ImValT, class ExtraValT> class HxExportExtraIdentMaskStdev< ResultT, ImValT, ExtraValT >

Functor for computation of the standard deviation of all values in an image identified by a mask.

8.61.2 Member Typedef Documentation

8.61.2.1 template<class ResultT, class ImValT, class ExtraValT> typedef HxTagTransInVar HxExportExtraIdentMaskStdev::TransVarianceCategory

Functor is translation invariant.

8.61.2.2 template<class ResultT, class ImValT, class ExtraValT> typedef HxTag1Phase HxExportExtraIdentMaskStdev::PhaseCategory

1 phase.

8.61.3 Constructor & Destructor Documentation

8.61.3.1 template<class ResultT, class ImValT, class ExtraValT> HxExportExtraIdentMaskStdev< ResultT, ImValT, ExtraValT >::HxExportExtraIdentMaskStdev (HxTagList & *tags*)

Constructor.

```
57                                              : _tags(tags)
58 {
59     _maskVal = HxGetTag<int>(tags, "maskVal");
60     _exportVariance = HxGetTag(tags, "exportVariance",false);
61     _sum = HxScalarInt(0);
62     _sumSqr = HxScalarInt(0);
63     _num = 0;
64 }
```

8.61.3.2 template<class ResultT, class ImValT, class ExtraValT> HxExportExtraIdentMaskStdev< ResultT, ImValT, ExtraValT >::~HxExportExtraIdentMaskStdev ()

Destructor.

```
68 {
69     ResultT num = _num;
70     ResultT num1 = _num - 1;
71     ResultT result = (_num == 1) ? ResultT(HxScalarInt(0))
72                                  : (_sumSqr - ((_sum * _sum) / num)) / (num1);
73     if(!_exportVariance)
74         result = result.sqrt();
75     HxAddTag(_tags, "result", HxValue(result));
76 }
```

8.61.4 Member Function Documentation

8.64 HxHistogram Class Reference

Class definition of histogram.

`#include <HxHistogram.h>`

Public Methods

Constructors

- **HxHistogram** ()
  Construct an empty histogram.
- **HxHistogram** (const HxHistogram &)
  Copy constructor.
- **HxHistogram** (int dimSize)
  Construct a 1D histogram with a range from 0 to dimSize - 1 and a binWidth of 1.
- **HxHistogram** (int dimSize1, int dimSize2)
  Construct a 2D histogram with a range from 0 to dimSize - 1 and a binWidth of 1 in each dimension.
- **HxHistogram** (int dimSize1, int dimSize2, int dimSize3)
  Construct a 3D histogram with a range from 0 to dimSize - 1 and a binWidth of 1 in each dimension.
- **HxHistogram** (**HxValueType** dataType, int dimensions, int dimSize1, int dimSize2=0, int dimSize3=0)
  Construct Histogram with given data type and number of dimensions.
- **HxHistogram** (**HxValueType** dataType, int dimensions, double lowBin1, double highBin1, int nBins1, double lowBin2, double highBin2, int nBins2, double lowBin3, double highBin3, int nBins3)
  Construct a Histogram with given parameters.
- **HxHistogram** (**HxString** filename)
  Read a Histogram from disk.

Destructor

- ~**HxHistogram** ()
  Destructor.

Operators

- HxHistogram & **operator=** (const HxHistogram &)
  Assignment operator.
- int **isNull** () const
  Indicates wether this is a valid histogram.
- **operator int** () const
  Indicates wether this is a valid histogram.

Inquiry

- int **ident** () const
  The unique identifier of the histogram.
- **HxValueType dataType** () const
  The data value type.
- int **dimensionality** () const
  The number of dimensions of the histogram.
- int **dimensionSize** (int dim) const
  The size of the histogram in the i-th dimension.
- int **nrOfBins** () const
  The total size of the histogram.
- double **lowBin** (int dim) const
  The lowest bin in the i-th dimension.
- double **highBin** (int dim) const
  The highest bin in the i-th dimension.
- double **binWidth** (int dim) const
  The bin width in the i-th dimension.
- double **binToValue** (int bin, int dimension) const
  Translate bin to value.
- int **valueToBin** (double value, int dimension) const
  Translate value to bin.
- double **get** (int bin1) const
  Get the number of elements in the given bin.
- double **get** (int bin1, int bin2) const
  Get the number of elements in the given bin.
- double **get** (int bin1, int bin2, int bin3) const
  Get the number of elements in the given bin.

Checked modification

- void **insertValChecked** (int val)

Insert value in 1D histogram.

- void **insertValChecked** (double val)
  Insert value in 1D histogram.
- void **insertValChecked** (**HxScalarInt** val)
  Insert value in 1D histogram.
- void **insertValChecked** (**HxScalarDouble** val)
  Insert value in 1D histogram.
- void **insertValChecked** (**HxVec2Int** val)
  Insert value in 2D histogram.
- void **insertValChecked** (**HxVec2Double** val)
  Insert value in 2D histogram.
- void **insertValChecked** (**HxVec3Int** val)
  Insert value in 3D histogram.
- void **insertValChecked** (**HxVec3Double** val)
  Insert value in 3D histogram.
- void **incBinChecked** (int bin)
  Increment the given bin.
- void **incBinChecked** (int bin1, int bin2)
  Increment the given bin.
- void **incBinChecked** (int bin1, int bin2, int bin3)
  Increment the given bin.

Unchecked modification

- void **insertVal** (int val)
  Insert value in 1D histogram.
- void **insertVal** (double val)
  Insert value in 1D histogram.
- void **insertVal** (double val, double sigma)
  Kernel Density Estimator.
- void **insertVal** (**HxScalarInt** val)
  Insert value in 1D histogram.
- void **insertVal** (**HxScalarDouble** val)
  Insert value in 1D histogram.
- void **insertVal** (**HxVec2Int** val)
  Insert value in 2D histogram.
- void **insertVal** (**HxVec2Double** val)
  Insert value in 2D histogram.

- void **insertVal** (**HxVec3Int** val)
  Insert value in 3D histogram.
- void **insertVal** (**HxVec3Double** val)
  Insert value in 3D histogram.
- void **incBin** (int bin)
  Increment the given bin (assumes 1D histogram).
- void **incBin** (int bin1, int bin2)
  Increment the given bin (assumes 2D histogram).
- void **incBin** (int bin1, int bin2, int bin3)
  Increment the given bin (assumes 3D histogram).
- void **setBin** (int bin1, long val)
  Reset the value of the given bin to val (assumes 1D histogram).
- void **setBin** (int bin1, int bin2, long val)
  Reset the value of the given bin to val (assumes 2D histogram).
- void **setBin** (int bin1, int bin2, int bin3, long val)
  Reset the value of the given bin to val (assumes 3D histogram).
- void **setBin** (int bin1, double val)
  Reset the value of the given bin to val (assumes 1D histogram).
- void **setBin** (int bin1, int bin2, double val)
  Reset the value of the given bin to val (assumes 2D histogram).
- void **setBin** (int bin1, int bin2, int bin3, double val)
  Reset the value of the given bin to val (assumes 3D histogram).

Statistics

- HxHistogram **smooth** (double sigma=3.0)
  Smooth histogram data.
- std::list< **HxVec2Double** > **modes** ()
  Get histogram modes.
- HxHistogram **normalize** (double weight=1.0)
  Normalize histogram data.
- double **sum** () const
  The sum of the histogram.
- double **minVal** () const
  The minimum number of elements in the histogram.
- double **minVal** (int *index) const
  The minimum number of elements in the histogram.

- double **maxVal** () const
  The maximum number of elements in the histogram.
- double **maxVal** (int *index) const
  The maximum number of elements in the histogram.
- double **intersection** (const HxHistogram &) const
  Intersection of histograms.
- double **chiSquare** (const HxHistogram &) const
  Chi square intersection of histograms.
- double **chiSquareNorm** (const HxHistogram &) const
  Normalized chi square intersection of histograms.

compute threshold value

- int **computeIsodataThreshold** (void)
- int **computeEntropyThreshold** (void)

Output/display

- HxHistogram **convert** (**HxValueType** dataType)
  convert dataType.
- void **getTheData** (double *x, double *y)
  Fill the externally allocated buffer with data from this histogram.
- void **getTheData2** (double *x1, double *x2, double *y)
  Fill the externally allocated buffer with data from this histogram.
- void **getTheData3** (double *x1, double *x2, double *x3, double *y)
  Fill the externally allocated buffer with data from this histogram.
- void **getDataDouble** (double *data)
  Fill the externally allocated buffer with data from this histogram.
- void **getDataInt** (int *data)
  Fill the externally allocated buffer with data from this histogram.
- void **render3d** (int *data, int dataWidth, int dataHeight, double elevation, double alpha, double threshold)
  Assume the histogram is a 3d rgb cube and render it for display in Java in the externally allocated data buffer.
- STD_OSTREAM & **put** (STD_OSTREAM &, **HxString** delimit="") const
  Print histogram data in the given stream.
- int **write** (**HxString** filename)
  Write histogram to disk.

Reduce operations

- HxHistogram **threshold** (double valThreshold)

  Returns new histogram in which bins with count<=valThreshold are set to 0.0, bins with count>valThreshold keep original value.

- int **countBins** (double valThreshold=0.0)

  Returns number of bins with count>valThreshold.

- HxHistogram **reduceRange** (int binMin1, int binMax1=-1, int binMin2=0, int binMax2=-1, int binMin3=0, int binMax3=-1)

  Returns new histogram containing given range of bins only.

- HxHistogram **reduceRangeVal** (double binValMin1, double binValMax1, double binValMin2=0, double binValMax2=0, double binValMin3=0, double binValMax3=0)

  Returns new histogram containing given range of values (mapped to bin numbers) only.

- HxHistogram **to1D** (int dim=1)

  Projects n-dimensional (1<n<=3) histogram on a 1-D histogram for given dimension.

8.64.1 Detailed Description

Class definition of histogram.

The current implementation supports 1, 2, and 3 dimensional histograms with real-valued data (no integer data yet). For each dimension a range (lowB - highB) and a number of bins has to be specified (typically highB - lowB + 1 to get a binWidth of 1). The number of bins in a given dimension is known as the dimensionSize. The width of a bin is defined as (highB - lowB) / (nBins - 1). The first bin goes from lowB to lowB + binWidth, the last bin from highB to highB + binWidth.

CHANGED: JMG CdB

8.64.2 Constructor & Destructor Documentation

8.64.2.1 HxHistogram::HxHistogram ()

Construct an empty histogram.

```
68                          : _data(0)
69 {
70 }
```

8.64.2.2 HxHistogram::HxHistogram (const HxHistogram & *rhs*)

Copy constructor.

```
72                                                  : _data(rhs._data)
73 {
74 }
```

8.64.2.3 HxHistogram::HxHistogram (int *dimSize*)

Construct a 1D histogram with a range from 0 to dimSize - 1 and a binWidth of 1.

```
77 {
78     _data = new HxHistogramData(REAL_VALUE, 1,
79                                 0, dimSize - 1, dimSize,
80                                 0, 0, 0,
81                                 0, 0, 0);
82 }
```

8.64.2.4 HxHistogram::HxHistogram (int *dimSize1*, int *dimSize2*)

Construct a 2D histogram with a range from 0 to dimSize - 1 and a binWidth of 1 in each dimension.

```
85 {
86     _data = new HxHistogramData(REAL_VALUE, 2,
87                                 0, dimSize1 - 1, dimSize1,
88                                 0, dimSize2 - 1, dimSize2,
89                                 0, 0, 0);
90 }
```

8.64.2.5 HxHistogram::HxHistogram (int *dimSize1*, int *dimSize2*, int *dimSize3*)

Construct a 3D histogram with a range from 0 to dimSize - 1 and a binWidth of 1 in each dimension.

```
93 {
94     _data = new HxHistogramData(REAL_VALUE, 3,
95                                 0, dimSize1 - 1, dimSize1,
96                                 0, dimSize2 - 1, dimSize2,
97                                 0, dimSize3 - 1, dimSize3);
98 }
```

8.64.2.6 HxHistogram::HxHistogram (HxValueType *dataType*, int *dimensions*, int *dimSize1*, int *dimSize2* = 0, int *dimSize3* = 0)

Construct Histogram with given data type and number of dimensions.

The range in a dimension is 0 to dimSize - 1, the binWidth is 1.

```
102 {
103     _data = new HxHistogramData(dataType, dimensions,
104                                 0, dimSize1 - 1, dimSize1,
105                                 0, dimSize2 - 1, dimSize2,
106                                 0, dimSize3 - 1, dimSize3);
107 }
```

8.64.2.7 HxHistogram::HxHistogram (HxValueType *dataType*, int *dimensions*, double *lowBin1*, double *highBin1*, int *nBins1*, double *lowBin2*, double *highBin2*, int *nBins2*, double *lowBin3*, double *highBin3*, int *nBins3*)

Construct a Histogram with given parameters.

If dataType == INT_VALUE parameters are casted.

```
113 {
114     _data = new HxHistogramData(dataType, dimensions,
115                                 lowBin1, highBin1, nBins1,
116                                 lowBin2, highBin2, nBins2,
117                                 lowBin3, highBin3, nBins3);
118 }
```

8.64.2.8 HxHistogram::HxHistogram (HxString *filename*)

Read a Histogram from disk.

```
125 {
126     HxString name;
127     FILE *fp;
128     IOHEADER header;
129 
130     name = filename + ".hst";
131 
132     fp = fopen(name.c_str(), "rb");
133     if (!fp)
134         _data = 0;
135     else {
136         fread(&header, sizeof(header), 1, fp);
137 
138         _data = new HxHistogramData(header.dataType, header.dimensions,
139                             header.lowBin1, header.highBin1, header.nBins1,
140                             header.lowBin2, header.highBin2, header.nBins2,
141                             header.lowBin3, header.highBin3, header.nBins3);
142 
143         if (_data->_dataType == REAL_VALUE)

149         fclose(fp);
150     }
151 }
```

8.64.2.9 HxHistogram::~HxHistogram ()

Destructor.

```
154 {
155 }
```

8.64.3 Member Function Documentation

8.64.3.1 HxHistogram & HxHistogram::operator= (const HxHistogram & *rhs*)

Assignment operator.

```
166 {
167     _data = rhs._data;
168     return *this;
169 }
```

8.64.3.2 int HxHistogram::isNull () const

Indicates wether this is a valid histogram.

```
173 {
174     return _data ? 0 : 1;
175 }
```

8.64.3.3 HxHistogram::operator int () const

Indicates wether this is a valid histogram.

```
179 {
180     return _data ? 1 : 0;
181 }
```

8.64.3.4 int HxHistogram::ident () const

The unique identifier of the histogram.

```
185 {
186     return _data ? _data->_id : 0 ;
187 }
```

8.64.3.5 HxValueType HxHistogram::dataType () const

The data value type.

Either INT_VALUE or REAL_VALUE.

```
191 {
192     return _data ? _data->_dataType : INT_VALUE;
193 }
```

8.64.3.6 int HxHistogram::dimensionality () const

The number of dimensions of the histogram.

```
197 {
198     return _data ? _data->_nDims : 0;
199 }
```

8.64.3.7 int HxHistogram::dimensionSize (int *dim*) const

The size of the histogram in the i-th dimension.

The first dimension has i = 1.

```
203 {
204     if (!_data)
205         return 0;
206     switch (dim) {
207     case 1: return _data->_dimSize1;
208     case 2: return _data->_dimSize2;
209     case 3: return _data->_dimSize3;
210     }
211     return 0;
212 }
```

8.64.3.8 int HxHistogram::nrOfBins () const

The total size of the histogram.

```
216 {
217     if (!_data)
218         return 0;
219     return _data->_totSize;
220 }
```

8.64.3.9 double HxHistogram::lowBin (int *dim*) const

The lowest bin in the i-th dimension.

```
224 {
225     if (!_data)
226         return 0;
227     switch (dim) {
228     case 1: return _data->_lowBin1;
229     case 2: return _data->_lowBin2;
230     case 3: return _data->_lowBin3;
231     }
232     return 0;
233 }
```

8.64.3.10 double HxHistogram::highBin (int *dim*) const

The highest bin in the i-th dimension.

```
237 {
238     if (!_data)
239         return 0;
240     switch (dim) {
241     case 1: return _data->_highBin1;
242     case 2: return _data->_highBin2;
243     case 3: return _data->_highBin3;
244     }
245     return 0;
246 }
```

8.64.3.11 double HxHistogram::binWidth (int *dim*) const

The bin width in the i-th dimension.

```
250 {
251     if (!_data)
252         return 0;
253     switch (dim) {
254     case 1: return _data->_binWidth1;
255     case 2: return _data->_binWidth2;
256     case 3: return _data->_binWidth3;
257     }
258     return 0;
259 }
```

8.64.3.12 double HxHistogram::binToValue (int *bin*, int *dimension*) const

Translate bin to value.

```
263 {
264     if (!_data)
265         return 0;
266     switch (dimension) {
267     case 1: return (bin+0.5) * _data->_binWidth1 + _data->_lowBin1;
268     case 2: return (bin+0.5) * _data->_binWidth2 + _data->_lowBin2;
269     case 3: return (bin+0.5) * _data->_binWidth3 + _data->_lowBin3;
270     }
271     return 0;
272 }
```

8.64.3.13 int HxHistogram::valueToBin (double *val*, int *dimension*) const

Translate value to bin.

```
276 {
277     if (!_data)
278         return -1;
279     switch (dimension) {
280     case 1: return (int) ((val - _data->_lowRange1) * _data->_binFac1);
281     case 2: return (int) ((val - _data->_lowRange2) * _data->_binFac2);
282     case 3: return (int) ((val - _data->_lowRange3) * _data->_binFac3);
283     }
284     return -1;
285 }
```

8.64.3.14 double HxHistogram::get (int *bin1*) const [inline]

Get the number of elements in the given bin.

```
464 {
465     return _data ? _data->getBin(bin1) : 0;
466 }
```

8.64.3.15 double HxHistogram::get (int *bin1*, int *bin2*) const [inline]

Get the number of elements in the given bin.

```
470 {
471     return _data ? _data->getBin(bin2 * _data->_dimSize1 + bin1) : 0;
472 }
```

8.64.3.16 double HxHistogram::get (int *bin1*, int *bin2*, int *bin3*) const [inline]

Get the number of elements in the given bin.

```
476 {
477     return _data ? _data->getBin((bin3 * _data->_dimSize2 + bin2) *
478                                  _data->_dimSize1 + bin1) : 0;
479 }
```

8.64.3.17 void HxHistogram::insertValChecked (int *val*)

Insert value in 1D histogram.

```
289 {
290     if (_data && (_data->_nDims == 1))
291         incBinChecked(
292             (int) ((val - _data->_lowRange1) * _data->_binFac1));
293 }
```

8.64.3.18 void HxHistogram::insertValChecked (double *val*)

Insert value in 1D histogram.

```
297 {
298     if (_data && (_data->_nDims == 1))
299         incBinChecked(
300             (int) ((val - _data->_lowRange1) * _data->_binFac1));
301 }
```

8.64.3.19 void HxHistogram::insertValChecked (HxScalarInt *val*)

Insert value in 1D histogram.

```
305 {
306     if (_data && (_data->_nDims == 1))
307         incBinChecked(
308             (int) ((val.x() - _data->_lowRange1) * _data->_binFac1));
309 }
```

8.64.3.20 void HxHistogram::insertValChecked (HxScalarDouble *val*)

Insert value in 1D histogram.

```
313 {
314     if (_data && (_data->_nDims == 1))
315         incBinChecked(
316             (int) ((val.x() - _data->_lowRange1) * _data->_binFac1));
317 }
```

8.64.3.21 void HxHistogram::insertValChecked (HxVec2Int *val*)

Insert value in 2D histogram.

```
321 {
322     if (_data && (_data->_nDims == 2))
323         incBinChecked(
324             (int) ((val.x() - _data->_lowRange1) * _data->_binFac1),
325             (int) ((val.y() - _data->_lowRange2) * _data->_binFac2));
326 }
```

8.64.3.22 void HxHistogram::insertValChecked (HxVec2Double *val*)

Insert value in 2D histogram.

```
330 {
331     if (_data && (_data->_nDims == 2))
332         incBinChecked(
333             (int) ((val.x() - _data->_lowRange1) * _data->_binFac1),
334             (int) ((val.y() - _data->_lowRange2) * _data->_binFac2));
335 }
```

8.64.3.23 void HxHistogram::insertValChecked (HxVec3Int *val*)

Insert value in 3D histogram.

```
339 {
340     if (_data && (_data->_nDims == 3))
341         incBinChecked(
342             (int) ((val.x() - _data->_lowRange1) * _data->_binFac1),
343             (int) ((val.y() - _data->_lowRange2) * _data->_binFac2),
344             (int) ((val.z() - _data->_lowRange3) * _data->_binFac3));
345 }
```

8.64.3.24 void HxHistogram::insertValChecked (HxVec3Double *val*)

Insert value in 3D histogram.

```
349 {
350     if (_data && (_data->_nDims == 3))
351         incBinChecked(
352             (int) ((val.x() - _data->_lowRange1) * _data->_binFac1),
353             (int) ((val.y() - _data->_lowRange2) * _data->_binFac2),
354             (int) ((val.z() - _data->_lowRange3) * _data->_binFac3));
355 }
```

8.64.3.25 void HxHistogram::incBinChecked (int *bin*)

Increment the given bin.

Checks whether this is a 1D histogram and preserves reference count. Values outside the histogram range are ignored.

```
359 {
360     if (_data) {
361         if ((_data->_nDims == 1) &&
362                 (bin >= 0) && (bin < _data->_dimSize1)) {
363             _data->getUnshared();
364             _data->incBin(bin);
365         }
366     }
367 }
```

8.64.3.26 void HxHistogram::incBinChecked (int *bin1*, int *bin2*)

Increment the given bin.

Checks whether this is a 2D histogram and preserves reference count. Values outside the histogram range are ignored.

```
371 {
372     if (_data) {
373         if ((_data->_nDims == 2) &&

439     }
440 }
```

8.64.3.31 void HxHistogram::insertVal (HxScalarInt *val*) [inline]

Insert value in 1D histogram.

```
570 {
571     incBin((int) ((val.x() - _data->_lowRange1) * _data->_binFac1));
572 }
```

8.64.3.32 void HxHistogram::insertVal (HxScalarDouble *val*) [inline]

Insert value in 1D histogram.

```
576 {
577     incBin((int) ((val.x() - _data->_lowRange1) * _data->_binFac1));
578 }
```

8.64.3.33 void HxHistogram::insertVal (HxVec2Int *val*) [inline]

Insert value in 2D histogram.

```
582 {
583     incBin((int) ((val.x() - _data->_lowRange1) * _data->_binFac1),
584             (int) ((val.y() - _data->_lowRange2) * _data->_binFac2));
585 }
```

8.64.3.34 void HxHistogram::insertVal (HxVec2Double *val*) [inline]

Insert value in 2D histogram.

```
589 {
590     incBin((int) ((val.x() - _data->_lowRange1) * _data->_binFac1),
591             (int) ((val.y() - _data->_lowRange2) * _data->_binFac2));
592 }
```

8.64.3.35 void HxHistogram::insertVal (HxVec3Int *val*) [inline]

Insert value in 3D histogram.

```
596 {
597     incBin((int) ((val.x() - _data->_lowRange1) * _data->_binFac1),

8.65 HxIfRbPair Class Reference

Representation for the result of a query of the rule base.

`#include <HxImgFtorRuleBase.h>`

Public Methods

- **HxIfRbPair** ()

  Constructor.

- **HxIfRbPair** (**HxImageSignature** s, bool f=true)

  Constructor.

- **operator int** ()

  Cast found to an integer.

- **operator HxImageSignature** ()

  Cast result to an **HxImageSignature** (p. 685).

Public Attributes

- bool **found**

  Was it really found?

- **HxImageSignature sig**

  The result.

8.65.1 Detailed Description

Representation for the result of a query of the rule base.

The result is basically an **HxImageSignature** (p. 685) annotaed with a flag ”found” telling whether the result was actually found in the rule base or was constructed from a default image signature.

8.65.2 Constructor & Destructor Documentation

8.65.2.1 HxIfRbPair::HxIfRbPair () [inline]

Constructor.

```
27 {}
```

8.65.2.2 HxIfRbPair::HxIfRbPair (HxImageSignature *s*, bool *f* = true) [inline]

Constructor.

```
31                                      : sig(s), found(f) {}
```

8.65.3 Member Function Documentation

8.65.3.1 HxIfRbPair::operator int () [inline]

Cast found to an integer.

```
39 { return found ? 1 : 0; }
```

8.65.3.2 HxIfRbPair::operator HxImageSignature () [inline]

Cast result to an **HxImageSignature** (p. 685).

```
41 { return sig; }
```

8.65.4 Member Data Documentation

8.65.4.1 bool HxIfRbPair::found

Was it really found?

8.65.4.2 HxImageSignature HxIfRbPair::sig

The result.

The documentation for this class was generated from the following file:

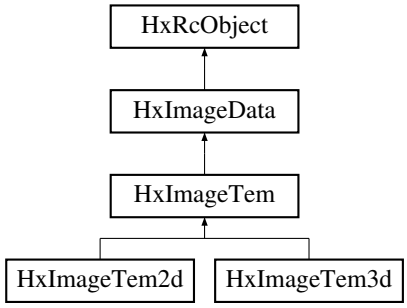
8.66 HxImageData Class Reference

The HxImageData class is the root in the cpp image hierarchy.

```
#include <HxImageData.h>
```

Inheritance diagram for HxImageData::



Constructors and destructor

- **HxImageData** ()

  Constructor.

- **HxImageData** (const HxImageData &)

  Copy constructor.

- virtual ~**HxImageData** ()

  Destructor.

Inquiry

- int **ident** () const

  Get identity.

- **HxString name** () const

  Get name.

- void **name** (**HxString** s)

  Set name.

- virtual int **dimensionality** () const=0

  Get dimensionality.

- virtual int **dimensionSize** (int i) const=0

  Get image size in given dimension.

- virtual **HxSizes sizes** () const=0

  Get image sizes.

- virtual int **numberOfPixels** () const=0

  Get total number of pixels.

- virtual int **pixelDimensionality** () const=0

Get dimensionality of pixels.

- virtual **HxValueType pixelType** () const=0

  Get type of pixel.

- virtual int **pixelPrecision** () const=0

  Get pixel precision.

- virtual **HxImageSignature signature** () const=0

  Get image signature.

Import/export operations

- virtual void **import** (**HxByte** ∗data, **HxTagList** &tags=HxMakeTagList(), **HxString** importOp=”importPix”)

  Import pixels from HxByte data.

- virtual void **import** (short ∗data, **HxTagList** &tags=HxMakeTagList(), **HxString** importOp=”importPix”)

  Import pixels from short data.

- virtual void **import** (int ∗data, **HxTagList** &tags=HxMakeTagList(), **HxString** importOp=”importPix”)

  Import pixels from int data.

- virtual void **import** (float ∗data, **HxTagList** &tags=HxMakeTagList(), **HxString** importOp=”importPix”)

  Import pixels from float data.

- virtual void **import** (double ∗data, **HxTagList** &tags=HxMakeTagList(), **HxString** importOp=”importPix”)

  Import pixels from double data.

- virtual void **exportOp** (**HxByte** ∗data, **HxTagList** &tags, **HxString** exportOp=”exportPix”)

  Export pixels as HxByte data.

- virtual void **exportOp** (short ∗data, **HxTagList** &tags, **HxString** exportOp=”exportPix”)

  Export pixels as short data.

- virtual void **exportOp** (int ∗data, **HxTagList** &tags, **HxString** exportOp=”exportPix”)

  Export pixels as int data.

- virtual void **exportOp** (float ∗data, **HxTagList** &tags, **HxString** exportOp=”exportPix”)

  Export pixels as float data.

- virtual void **exportOp** (double ∗data, **HxTagList** &tags, **HxString** exportOp=”exportPix”)

  Export pixels as double data.

- virtual void **inout** (void ∗data, **HxString** dataType, **HxString** inOutOp, **HxTagList** &tags)

InOut operation.

- virtual void **inout** (**HxString** inOutOp, **HxTagList** &tags)

  InOut operation (the real one).

- virtual void **exportExtra** (**HxString** exportOp, HxImageData *extraIm, **HxTagList** &tags)

  Export operation with extra image.

Set and border operations

- virtual void **set** (const **HxValue** val)
- virtual void **set** (HxImageData *arg)
- virtual void **set** (int *pixels)
- virtual void **set** (**HxByte** *pixels)
- virtual void **set** (double *pixels)=0
- void **setPartImage** (HxImageData *src)
- void **setPartImage** (HxImageData *src, **HxTagList** &tags)

  Set operation (the real one).

- void **setPartImage** (HxImageData *src, **HxPointInt** srcBegin, **HxPointInt** srcEnd, **HxPointInt** dstBegin)
- void **setBorder** (**HxTagList** &tags)

  Set border operation (the real one).

- void **setBorder** (**HxSizes** borderSize, **HxTagList** &tags, HxBorderType borderType=HXBORDERMIRROR)
- void **setBorder** (HxBorderType borderType, **HxSizes** borderSize, **HxTagList** &tags)
- void **setBorder** (**HxSizes** borderSize, **HxValue** val)
- void **mirrorBorder** (**HxSizes** borderSize)
- void **propagateBorder** (**HxSizes** borderSize)

Generic operations

- virtual void **unaryPixOp** (HxImageData *src, **HxString** upoName, **HxTagList** &tags)

  Unary pixel operation.

- virtual void **binaryPixOp** (HxImageData *arg1, HxImageData *arg2, **HxString** bpoName, **HxTagList** &tags)

  Binary pixel operation.

- virtual void **multiPixOp** (HxImageData **args, int nArgs, **HxString** mpoName, **HxTagList** &tags)

  Multi pixel operation.

- virtual void **generalizedConvolution** (HxImageData *srcImg, HxImageData *kerImg, **HxString** genMul, **HxString** genAdd, **HxString** kerName, **HxTagList** &tags)

  Generalized convolution operation.

- virtual void **generalizedConvolutionK1d** (HxImageData ∗srcImg, int dimension, HxImageData ∗kerImg, **HxString** genMul, **HxString** genAdd, **HxString** kerName, **HxTagList** &tags)

  Generalized convolution operation in one dimension.

- virtual void **genConvSeparated** (HxImageData ∗srcImg, int dimension, HxImageData ∗kerImg1, HxImageData ∗kerImg2, **HxString** genMul, **HxString** genAdd, **HxString** kerName, **HxTagList** &tags)

  Generalized convolution operation separated by dimension.

- virtual void **genConv2dSep** (HxImageData ∗srcImg, HxImageData ∗kerImg1, HxImageData ∗kerImg2, **HxString** genMul, **HxString** genAdd, **HxString** kerName, **HxTagList** &tags)

  Separable generalized convolution operation on 2D images.

- virtual void **genConv3dSep** (HxImageData ∗srcImg, HxImageData ∗kerImg1, HxImageData ∗kerImg2, HxImageData ∗kerImg3, **HxString** genMul, **HxString** genAdd, **HxString** kerName, **HxTagList** &tags)

  Separable generalized convolution operation on 3D images.

- virtual void **recGenConv** (HxImageData ∗srcImg, HxImageData ∗kerImg, **HxString** genMul, **HxString** genAdd, **HxTagList** &tags)

  Recursive generalized convolution operation.

- virtual void **recGenConv2dSep** (HxImageData ∗srcImg, HxImageData ∗kerImg1, HxImageData ∗kerImg2, **HxString** genMul, **HxString** genAdd, **HxTagList** &tags)

  Separable recursive generalized convolution operation on 2D images.

- virtual void **neighbourhoodOp** (HxImageData ∗src, **HxString** ngbName, **HxTagList** &tags)

  Neighbourhood operation.

- virtual void **neighbourhoodOpExtra** (HxImageData ∗src, HxImageData ∗extraIm, **HxString** ngbName, **HxTagList** &tags)

  Neighbourhood operation with extra image.

- virtual void **neighbourhoodOpExtra2** (HxImageData ∗src, HxImageData ∗extraIm, HxImageData ∗extraIm2, **HxString** ngbName, **HxTagList** &tags)

  Neighbourhood operation with extra images.

- virtual void **neighbourhoodOp** (HxImageData ∗src, HxImageData ∗kernel, **HxString** ngbName, **HxTagList** &tags)

  Neighbourhood operation with kernel.

- virtual void **queueBasedOp** (HxImageData ∗srcImg, HxImageData ∗kerImg, **HxString** genOp, **HxTagList** &tags)

  Queue based operation.

- virtual void **diyOp** (HxImageData ∗src, **HxString** diyName, **HxTagList** &tags)

  Do it yourself operation.

- virtual void **rgbOp** (**HxString** rgbName, **HxTagList** &tags)

  Display operation.

- void **MNPixOp** (HxImageData **results, int resultCnt, HxImageData **args, int argCnt, **HxString** mpoName, **HxTagList** &tags)

  M output N input pixel operation.

Geometric operations

- virtual void **geometricOp2d** (HxImageData *arg, **HxMatrix** func, **HxGeoIntType** gi, **HxVec3Double** translate, **HxValue** background)=0

  Geometric operation on 2D images.

- virtual void **restrict** (HxImageData *arg, **HxPoint** begin)
- virtual void **extend** (HxImageData *arg, **HxPoint** begin)
- virtual HxImageData * **projectDomain** (int dimension, int coordinate)=0

8.66.1 Detailed Description

The HxImageData class is the root in the cpp image hierarchy.

All operations on images can be accessed by this interface, yet little of them are implemented by this class. This class serves as a handle of all types of images that are derived from this base class. The HxImageData class provides methods to make inquiries about the type of the image.

8.66.2 Constructor & Destructor Documentation

8.66.2.1 HxImageData::HxImageData ()

Constructor.

```
52 {
53     _ident = _nr++;
54     _name = HxString("image") + makeString(_ident);
55     _weight = 1;
56     HxImageDataRepository::instance()->insertImage(this);
57     if (_objectObserver)
58         _objectObserver->constructed(_name);
59 }
```

8.66.2.2 HxImageData::HxImageData (const HxImageData &)

Copy constructor.

```
61                                          : HxRcObject()
62 {
63     HxEnvironment::instance()->warningStream() <<
64         "HxImageData copy constructor called" << STD_ENDL;
65     HxEnvironment::instance()->flush();
66 }
```

8.66.2.3 HxImageData::~HxImageData () [virtual]

Destructor.

```
69 {
70     HxImageDataRepository::instance()->removeImage(this);
71     if (_objectObserver)
72         _objectObserver->destructed(_name);
73 }
```

8.66.3 Member Function Documentation

8.66.3.1 int HxImageData::ident () const

Get identity.

```
77 {
78     return _ident;
79 }
```

8.66.3.2 HxString HxImageData::name () const

Get name.

```
83 {
84     return _name;
85 }
```

8.66.3.3 void HxImageData::name (HxString *s*)

Set name.

```
89 {
90     _name = s;
91 }
```

8.66.3.4 virtual int HxImageData::dimensionality () const [pure virtual]

Get dimensionality.

Reimplemented in **HxImageTem** (p. 695).

8.66.3.5 virtual int HxImageData::dimensionSize (int *i*) const [pure virtual]

Get image size in given dimension.

Reimplemented in **HxImageTem** (p. 695).

8.66.3.6 virtual HxSizes HxImageData::sizes () const [pure virtual]

Get image sizes.

Reimplemented in **HxImageTem** (p. 695).

8.66.3.7 virtual int HxImageData::numberOfPixels () const [pure virtual]

Get total number of pixels.

Reimplemented in **HxImageTem** (p. 696).

8.66.3.8 virtual int HxImageData::pixelDimensionality () const [pure virtual]

Get dimensionality of pixels.

Reimplemented in **HxImageTem** (p. 696).

8.66.3.9 virtual HxValueType HxImageData::pixelType () const [pure virtual]

Get type of pixel.

Reimplemented in **HxImageTem** (p. 696).

8.66.3.10 virtual int HxImageData::pixelPrecision () const [pure virtual]

Get pixel precision.

Reimplemented in **HxImageTem** (p. 696).

8.66.3.11 virtual HxImageSignature HxImageData::signature () const [pure virtual]

Get image signature.

Reimplemented in **HxImageTem** (p. 697).

8.66.3.12 void HxImageData::import (HxByte * *data*, HxTagList & *tags* = HxMakeTagList(), HxString *importOp* = "importPix") [virtual]

Import pixels from HxByte data.

```
1062 {
1063     inout((void*)data, HxClassName<HxByte>(), importOp, tags);
1064 }
```

8.66.3.13 void HxImageData::import (short * *data*, HxTagList & *tags* = HxMakeTagList(), HxString *importOp* = "importPix") [virtual]

Import pixels from short data.

```
1068 {
1069     inout((void*)data, HxClassName<short>(), importOp, tags);
1070 }
```

8.66.3.14 void HxImageData::import (int * *data*, HxTagList & *tags* = HxMakeTagList(), HxString *importOp* = "importPix") [virtual]

Import pixels from int data.

```
1074 {
1075     inout((void*)data, HxClassName<int>(), importOp, tags);
1076 }
```

8.66.3.15 void HxImageData::import (float * *data*, HxTagList & *tags* = HxMakeTagList(), HxString *importOp* = "importPix") [virtual]

Import pixels from float data.

```
1080 {
1081     inout((void*)data, HxClassName<float>(), importOp, tags);
1082 }
```

8.66.3.16 void HxImageData::import (double * *data*, HxTagList & *tags* = HxMakeTagList(), HxString *importOp* = "importPix") [virtual]

Import pixels from double data.

```
1086 {
1087     inout((void*)data, HxClassName<double>(), importOp, tags);
1088 }
```

8.66.3.17 void HxImageData::exportOp (HxByte * *data*, HxTagList & *tags*, HxString *exportOp* = "exportPix") [virtual]

Export pixels as HxByte data.

```
1092 {
1093     inout((void*)data, HxClassName<HxByte>(), exportOp, tags);
1094 }
```

8.66.3.18 void HxImageData::exportOp (short * *data*, HxTagList & *tags*, HxString *exportOp* = "exportPix") [virtual]

Export pixels as short data.

```
1098 {
1099     inout((void*)data, HxClassName<short>(), exportOp, tags);
1100 }
```

8.66.3.19 void HxImageData::exportOp (int * *data*, HxTagList & *tags*, HxString *exportOp* = "exportPix") [virtual]

Export pixels as int data.

```
1104 {
1105     inout((void*)data, HxClassName<int>(), exportOp, tags);
1106 }
```

8.66.3.20 void HxImageData::exportOp (float * *data*, HxTagList & *tags*, HxString *exportOp* = "exportPix") [virtual]

Export pixels as float data.

```
1110 {
1111     inout((void*)data, HxClassName<float>(), exportOp, tags);
1112 }
```

8.66.3.21 void HxImageData::exportOp (double * *data*, HxTagList & *tags*, HxString *exportOp* = "exportPix") [virtual]

Export pixels as double data.

```
1116 {
1117     inout((void*)data, HxClassName<double>(), exportOp, tags);
1118 }
```

8.66.3.22 void HxImageData::inout (void * *data*, HxString *dataType*, HxString *inOutOp*, HxTagList & *tags*) [virtual]

InOut operation.

```
1123 {
1124     inOutOp += HxString("<") + dataType + ">";
1125     HxAddTag(tags, "dataPtr", data);
1126     inout(inOutOp, tags);
1127 }
```

8.66.3.23 void HxImageData::inout (HxString *inOutOp*, HxTagList & *tags*) [virtual]

InOut operation (the real one).

```
1131 {
1132     HxImgFtorInOutKey funcKey(signature().toString(), inOutOp);
1133
1134     static HxImgFtorTableTem<HxImgFtorI1> funcTable;
1135     HxImgFtorI1* func = funcTable.find(funcKey);
1136
1137     if (func) {
1138         func->callIt(this, tags);
```

```
1139     } else {
1140         HxEnvironment::instance()->errorStream()
1141             << "Can't find " << funcKey << STD_ENDL;
1142         HxEnvironment::instance()->flush();
1143     }
1144 }
```

8.66.3.24 void HxImageData::exportExtra (HxString *exportOp*, HxImageData * *extraIm*, HxTagList & *tags*) [virtual]

Export operation with extra image.

```
1149 {
1150     HxImgFtorExportExtraKey funcKey(signature().toString(),
1151                                     extraIm->signature().toString(),
1152                                     exportOp);
1153
1154     static HxImgFtorTableTem<HxImgFtorI2> funcTable;
1155     HxImgFtorI2* func = funcTable.find(funcKey);
1156
1157     if (func) {
1158         func->callIt(this, extraIm, tags);
1159     } else {
1160         HxEnvironment::instance()->errorStream()
1161             << "Can't find " << funcKey << STD_ENDL;
1162         HxEnvironment::instance()->flush();
1163     }
1164 }
```

8.66.3.25 void HxImageData::setPartImage (HxImageData * *src*, HxTagList & *tags*)

Set operation (the real one).

```
1213 {
1214     HxImgFtorSetKey funcKey(signature().toString(),
1215                         src->signature().toString());
1216
1217     static HxImgFtorTableTem<HxImgFtorI2> funcTable;
1218     HxImgFtorI2* func = funcTable.find(funcKey);
1219
1220     if (func) {
1221         func->callIt(this, src, tags);
1222     } else {
1223         HxEnvironment::instance()->errorStream()
1224             << "Can't find " << funcKey << STD_ENDL;
1225         HxEnvironment::instance()->flush();
1226     }
1227 }
```

8.66.3.26 void HxImageData::setBorder (HxTagList & *tags*)

Set border operation (the real one).

```

Geometric operation on 2D images.

Reimplemented in **HxImageTem2d** (p. 698), and **HxImageTem3d** (p. 700).

The documentation for this class was generated from the following files:

- **HxImageData.h**
- HxImageData.c

8.67 HxImageFactory Class Reference

Factory for **HxImageRep** (p. 620) objects.

`#include <HxImageFactory.h>`

Public Methods

- **HxImageRep fromSignature** (const **HxImageSignature** &signature, **HxSizes** sizes)

  Uninitialized image with given signature and sizes.

- **HxImageRep fromImage** (const **HxImageSignature** &signature, **HxImageRep** src)

  New image with given signature.

- **HxImageRep fromValue** (const **HxImageSignature** &signature, **HxSizes** sizes, **HxValue** val)

  New image with given signature and sizes.

- **HxImageRep fromByteData** (int pixelDimensionality, int dimensions, **HxSizes** sizes, **HxByte** *data)

  New image with given signature and sizes.

- **HxImageRep fromShortData** (int pixelDimensionality, int dimensions, **HxSizes** sizes, short *data)

  New image with given signature and sizes.

- **HxImageRep fromIntData** (int pixelDimensionality, int dimensions, **HxSizes** sizes, int *data)

  New image with given signature and sizes.

- **HxImageRep fromFloatData** (int pixelDimensionality, int dimensions, **HxSizes** sizes, float *data)

  New image with given signature and sizes.

- **HxImageRep fromDoubleData** (int pixelDimensionality, int dimensions, **HxSizes** sizes, double *data)

  New image with given signature and sizes.

- **HxImageRep fromGenerator** (const **HxImageSignature** &signature, const HxImageGenerator *imgGenerator) const

  New image with given signature.

- **HxImageRep fromNamedGenerator** (const **HxImageSignature** &signature, **HxString** generatorName, **HxTagList** &tags) const

  New image with given signature.

- **HxImageRep fromJavaRgb** (const **HxImageSignature** &signature, **HxSizes** sizes, int *pixels)

  New image with given signature and sizes.

- **HxImageRep fromGrayValue** (const **HxImageSignature** &signature, **HxSizes** sizes, **HxByte** *pixels)

  New image with given signature and sizes.

- **HxImageRep fromMatlab** (const **HxImageSignature** &signature, **HxSizes** sizes, double *pixels)

  New image with given signature and sizes.

- **HxImageRep fromImport** (const **HxImageSignature** &signature, **HxSizes** sizes, **HxString** importOp, **HxTagList** &tags)

  New image with given signature and sizes.

- **HxImageRep from2Images** (**HxImageRep** i1, **HxImageRep** i2)

  New image with pixel values "stacked" from given arguments.

- **HxImageRep from3Images** (**HxImageRep** i1, **HxImageRep** i2, **HxImageRep** i3)

  New image with pixel values "stacked" from given arguments.

- **HxImageRep fromFile** (**HxString** fileName, **HxTagList** &tags)

  New image read from file using HxImgFileIo lib.

- bool **writeFile** (**HxImageRep** img, **HxString** fileName, **HxTagList** &tags) const

  Write image to file using HxImgFileIo lib.

- bool **imagesToFile** (**HxImageList** imgs, **HxString** fileName, **HxTagList** &tags) const

  Write set of image to file using HxImgFileIo lib.

- **HxImageList imagesFromFile** (**HxString** fileName, **HxTagList** &tags)

  Read set of image from file using HxImgFileIo lib.

- void **subscribeGenerator** (**HxString** name, HxImageGenerator *)
- void **unSubscribeGenerator** (**HxString** name, HxImageGenerator *)
- HxImageGenerator * **getGenerator** (**HxString** name) const

Static Public Methods

- HxImageFactory & **instance** ()

  The one and only instance of this class.

8.67.1 Detailed Description

Factory for **HxImageRep** (p. 620) objects.

8.67.2 Member Function Documentation

8.67.2.1 HxImageFactory & HxImageFactory::instance () [static]

The one and only instance of this class.

```
24 {
25     static HxImageFactory theFactory;
26     return theFactory;
27 }
```

8.67.2.2 HxImageRep HxImageFactory::fromSignature (const HxImageSignature & *signature*, HxSizes *sizes*)

Uninitialized image with given signature and sizes.

```
32 {
33     HxImageData* imgData = construct(signature, sizes);
34     return HxImageRep(imgData);
35 }
```

8.67.2.3 HxImageRep HxImageFactory::fromImage (const HxImageSignature & *signature*, HxImageRep *src*)

New image with given signature.

Sizes and data are taken from given image.

```
39 {
40     HxImageData* imgData = construct(signature, src.sizes());
41     if (imgData && src.pointee())
42         imgData->set(src.pointee());
43     return HxImageRep(imgData);
44 }
```

8.67.2.4 HxImageRep HxImageFactory::fromValue (const HxImageSignature & *signature*, HxSizes *sizes*, HxValue *val*)

New image with given signature and sizes.

Pixel data is initialized with given value.

```
49 {
50     HxImageData* imgData = construct(signature, sizes);
51     if (imgData)
52         imgData->set(val);
53     return HxImageRep(imgData);
54 }
```

8.67.2.5 HxImageRep HxImageFactory::fromByteData (int *pixelDimensionality*, int *dimensions*, HxSizes *sizes*, HxByte * *data*)

New image with given signature and sizes.

Pixel data is initialized from given values.

```
59 {
60     HxImageSignature signature(
61         dimensions, pixelDimensionality, INT_VALUE, sizeof(HxByte)<<3);
62     HxImageData* imgData = construct(signature, sizes);
63     if (imgData)
64         imgData->import(data);
65     return HxImageRep(imgData);
66 }
```

8.67.2.6 HxImageRep HxImageFactory::fromShortData (int *pixelDimensionality*, int *dimensions*, HxSizes *sizes*, short * *data*)

New image with given signature and sizes.

Pixel data is initialized from given values.

```
71 {
72     HxImageSignature signature(
73         dimensions, pixelDimensionality, INT_VALUE, sizeof(short)<<3);
74     HxImageData* imgData = construct(signature, sizes);
75     if (imgData)
76         imgData->import(data);
77     return HxImageRep(imgData);
78 }
```

8.67.2.7 HxImageRep HxImageFactory::fromIntData (int *pixelDimensionality*, int *dimensions*, HxSizes *sizes*, int * *data*)

New image with given signature and sizes.

Pixel data is initialized from given values.

```
83 {
84     HxImageSignature signature(
85         dimensions, pixelDimensionality, INT_VALUE, sizeof(int)<<3);
86     HxImageData* imgData = construct(signature, sizes);
87     if (imgData)
88         imgData->import(data);
89     return HxImageRep(imgData);
90 }
```

8.67.2.8 HxImageRep HxImageFactory::fromFloatData (int *pixelDimensionality*, int *dimensions*, HxSizes *sizes*, float * *data*)

New image with given signature and sizes.

Pixel data is initialized from given values.

```
95 {
96     HxImageSignature signature(
97         dimensions, pixelDimensionality, REAL_VALUE, sizeof(float)<<3);
98     HxImageData* imgData = construct(signature, sizes);
99     if (imgData)
100         imgData->import(data);
101     return HxImageRep(imgData);
102 }
```

8.67.2.9 HxImageRep HxImageFactory::fromDoubleData (int *pixelDimensionality*, int *dimensions*, HxSizes *sizes*, double * *data*)

New image with given signature and sizes.

Pixel data is initialized from given values.

```
107 {
108     HxImageSignature signature(
109         dimensions, pixelDimensionality, REAL_VALUE, sizeof(double)<<3);
110     HxImageData* imgData = construct(signature, sizes);
111     if (imgData)
112         imgData->import(data);
113     return HxImageRep(imgData);
114 }
```

8.67.2.10 HxImageRep HxImageFactory::fromGenerator (const HxImageSignature & *signature*, const HxImageGenerator * *imgGenerator*) const

New image with given signature.

Pixel data and size are determined by image generator.

```
120 {
121     HxImageData* imgData = construct(signature, imgGenerator->domainSize());
122     HxTagList tags;
123     HxAddTag(tags, "imageGenerator", imgGenerator);
124     if (imgData)
125     {
126         imgData->inout("generate", tags);
127     }
128     return HxImageRep(imgData);
129 }
```

8.67.2.11 HxImageRep HxImageFactory::fromNamedGenerator (const HxImageSignature & *signature*, HxString *generatorName*, HxTagList & *tags*) const

New image with given signature.

Pixel data and size are determined by image generator.

```
135 {
136     HxImageGenerator* generator = getGenerator(generatorName);
137
138     if (!generator)
139         return HxImageRep();
```

```
140
141     generator->init(tags);
142     HxImageData* imgData = construct(signature, generator->domainSize());
143     HxTagList ttags;
144     HxAddTag(ttags, "imageGenerator", generator);
145     if (imgData)
146     {
147         imgData->inout("generate", ttags);
148     }
149     return HxImageRep(imgData);
150 }
```

8.67.2.12 HxImageRep HxImageFactory::fromJavaRgb (const HxImageSignature & *signature*, HxSizes *sizes*, int * *pixels*)

New image with given signature and sizes.

Pixel data is initialized from given values. The given values are stored in Java RGB format.

```
155 {
156     HxImageData* imgData = construct(signature, sizes);
157     if (imgData)
158         imgData->set(pixels);
159     return HxImageRep(imgData);
160 }
```

8.67.2.13 HxImageRep HxImageFactory::fromGrayValue (const HxImageSignature & *signature*, HxSizes *sizes*, HxByte * *pixels*)

New image with given signature and sizes.

Pixel data is initialized from given values.

```
165 {
166     HxImageData* imgData = construct(signature, sizes);
167     if (imgData)
168         imgData->set(pixels);
169     return HxImageRep(imgData);
170 }
```

8.67.2.14 HxImageRep HxImageFactory::fromMatlab (const HxImageSignature & *signature*, HxSizes *sizes*, double * *pixels*)

New image with given signature and sizes.

Pixel values are initialized from given values. The given values are stored in Matlab format.

```
175 {
176     HxImageData* imgData = construct(signature, sizes);
177     if (imgData)
178         imgData->set(pixels);
179     return HxImageRep(imgData);
180 }
```

8.67.2.15 HxImageRep HxImageFactory::fromImport (const HxImageSignature & *signature*, HxSizes *sizes*, HxString *importOp*, HxTagList & *tags*)

New image with given signature and sizes.

Pixel values are initialized by specified import operator.

```
186 {
187     HxImageData* imgData = construct(signature, sizes);
188     if (imgData)
189         imgData->inout(importOp, tags);
190     return HxImageRep(imgData);
191 }
```

8.67.2.16 HxImageRep HxImageFactory::from2Images (HxImageRep *i1*, HxImageRep *i2*)

New image with pixel values ”stacked” from given arguments.

For example, if i1 and i2 are scalar images the pixel values in the new image are 2-vectors. Result may need exceed highest pixel dimensionality.

```
195 {
196     STD_OSTREAM& errorStream = HxEnvironment::instance()->errorStream();
197
198     if (!(i1 && i2)) {
199         errorStream << "Source images may not be null" << STD_ENDL;
200         HxEnvironment::instance()->flush();
201         return HxImageRep();
202     }
203     if (i1.signature() != i2.signature()) {
204         errorStream << "Source images differ in type" << STD_ENDL;
205         HxEnvironment::instance()->flush();
206         return HxImageRep();
207     }
208     if (i1.sizes() != i2.sizes()) {
209         errorStream << "Source images differ in size" << STD_ENDL;
210         HxEnvironment::instance()->flush();
211         return HxImageRep();
212     }
213     HxImageSignature signature(i1.signature());
214     HxSizes sizes(i1.sizes());
215
216     if (signature.pixelDimensionality() != 1) {
217         errorStream << "HxImageRep: images must have pixelDimensionality of 1"
218                     << STD_ENDL;
219         HxEnvironment::instance()->flush();
220         return HxImageRep();
221     }
222     signature.setPixelDimensionality(2);
223     HxImageData* imgData = construct(signature, sizes);
224     if (imgData)
225     {
226         HxTagList tags;
227         imgData->binaryPixOp(
228             i1.pointee(), i2.pointee(), "vector2d", tags);
229     }
230     return HxImageRep(imgData);
231 }
```

8.67.2.17 HxImageRep HxImageFactory::from3Images (HxImageRep *i1*, HxImageRep *i2*, HxImageRep *i3*)

New image with pixel values "stacked" from given arguments.

For example, if i1, i2, and i3 are scalar images the pixel values in the new image are 3-vectors. Result may need exceed highest pixel dimensionality.

```
235 {
236     STD_OSTREAM& errorStream = HxEnvironment::instance()->errorStream();
237     if (!(i1 && i2 && i3)) {
238         errorStream << "Source images may not be null" << STD_ENDL;
239         HxEnvironment::instance()->flush();
240         return HxImageRep();
241     }
242     if ((i1.signature() != i2.signature())

- **HxImageList.h**

8.69 HxImageRep Class Reference

Class definition of Horus image representation.

`#include <HxImageRep.h>`

Constructors

- **HxImageRep** ()

  Null image.

- **HxImageRep** (const HxImageRep &)

  Copy constructor.

Destructor

- ~**HxImageRep** ()

  Destructor.

Operators

- HxImageRep & **operator=** (const HxImageRep &)
  Assignment operator.
- int **operator==** (const HxImageRep &arg) const
  Equality.
- int **isNull** () const
  Indicates wether this is a valid image.
- **operator int** () const
  Indicates wether this is a valid image.

Inquiry

- int **ident** () const
  The unique identifier of the image.
- **HxString name** () const
  The (not necessarily unique) name of the image.
- void **name** (**HxString** s)
  Sets the name of the image.
- int **dimensionality** () const
  The number of dimensions of the image.
- int **dimensionSize** (int i) const
  The size of the image in the i-th dimension.
- **HxSizes sizes** () const
  The dimension sizes of the image.
- int **numberOfPixels** () const
  The total number of pixels in the image.
- int **pixelDimensionality** () const
  The number of dimensions of one pixel.
- **HxValueType pixelType** () const
  The pixel range value type.
- int **pixelPrecision** () const
  The pixel size in bits.
- **HxImageSignature signature** () const
  The signature of the image.

Unary pixel operations

- HxImageRep **unaryPixOp** (**HxString** upoName, **HxTagList** &tags=HxMakeTagList()) const

  Unary pixel operation.

Binary pixel operations

- HxImageRep **binaryPixOp** (const **HxValue** arg, **HxString** bpoName, **HxTagList** &tags=HxMakeTagList()) const

  Binary pixel operation.

- HxImageRep **binaryPixOp** (const HxImageRep arg, **HxString** bpoName, **HxTagList** &tags=HxMakeTagList()) const

  Binary pixel operation.

Multi pixel operations.

- HxImageRep **multiPixOp** (const **HxImageList** &args, **HxString** mpoName, **HxTagList** &tags=HxMakeTagList()) const

  Multi pixel operation.

- **HxImageList MNPixOp** (const **HxImageList** &args, **HxString** mpoName, **HxTagList** &tags=HxMakeTagList()) const

  M output N input pixel operation.

Export operations

- void **exportOp** (**HxString** exportName, **HxTagList** &tags=HxMakeTagList()) const

  Export operation.

- void **exportOpExtra** (**HxString** exportName, HxImageRep extraIm, **HxTagList** &tags=HxMakeTagList()) const

  Export operation with an extra image.

- **HxValue reduceOp** (**HxString** op, **HxTagList** &tags=HxMakeTagList()) const

  Reduce operation.

Generalized convolution operations.

- HxImageRep **generalizedConvolution** (HxImageRep kerImg, **HxString** gMul, **HxString** gAdd, **ResultPrecision** resPrec=DEFAULT_PREC, **HxTagList** &tags=HxMakeTagList()) const

  Generalized convolution operation.

- HxImageRep **generalizedConvolutionK1d** (int dimension, HxImageRep kerImg, **HxString** gMul, **HxString** gAdd, **ResultPrecision** resPrec=DEFAULT_PREC, **HxTagList** &tags=HxMakeTagList()) const

Generalized convolution operation in one dimension.

- HxImageRep **genConvSeparated** (HxImageRep kernel, **HxString** gMul, **HxString** gAdd, **ResultPrecision** resPrec=DEFAULT_PREC, **HxTagList** &tags=HxMakeTagList()) const

  Generalized convolution operation separated for each dimension.

- HxImageRep **genConv2dSep** (HxImageRep kernel1, HxImageRep kernel2, **HxString** gMul, **HxString** gAdd, **ResultPrecision** resPrec=DEFAULT_PREC, **HxTagList** &tags=HxMakeTagList()) const

  Generalized convolution operation on 2d images separated for each dimension.

- HxImageRep **genConv3dSep** (HxImageRep kernel1, HxImageRep kernel2, HxImageRep kernel3, **HxString** gMul, **HxString** gAdd, **ResultPrecision** resPrec=DEFAULT_PREC, **HxTagList** &tags=HxMakeTagList()) const

  Generalized convolution operation on 3d images separated for each dimension.

Recursive generalized convolution operations.

- HxImageRep **recGenConv** (HxImageRep kerImg, **HxString** gMul, **HxString** gAdd, **ResultPrecision** resPrec=DEFAULT_PREC, **HxTagList** &tags=HxMakeTagList()) const

  Recursive generalized convolution operation.

- HxImageRep **recGenConv2dSep** (HxImageRep kernel1, HxImageRep kernel2, **HxString** gMul, **HxString** gAdd, **ResultPrecision** resPrec=DEFAULT_PREC, **HxTagList** &tags=HxMakeTagList()) const

  Recursive generalized convolution operation on 2d images separated for each dimension.

Neighbourhood operations.

- HxImageRep **neighbourhoodOp** (**HxString** ngbName, **HxTagList** &tags=HxMakeTagList()) const

  Neighbourhood operation.

- HxImageRep **neighbourhoodOpExtra** (**HxString** ngbName, HxImageRep extraIm, **HxTagList** &tags=HxMakeTagList()) const

  Neighbourhood operation with an extra image.

- HxImageRep **neighbourhoodOpExtra2** (**HxString** ngbName, HxImageRep extraIm, HxImageRep extraIm2, **HxTagList** &tags=HxMakeTagList()) const

  Neighbourhood operation with two extra images.

- HxImageRep **neighbourhoodOp** (HxImageRep kernel, **HxString** ngbName, **HxTagList** &tags=HxMakeTagList()) const

  Neighbourhood operation with kernel.

Queue based operations.

- HxImageRep **queueBasedOp** (HxImageRep kernel, **HxString** qName, **HxTagList** &tags=HxMakeTagList()) const

  Queue based operation.

Geometric operations.

- HxImageRep **geometricOp2d** (**HxMatrix** func, **HxGeoIntType** gi=LINEAR, HxGeoTransType gt=FORWARD, int adjustSize=1, **HxValue** background=**HxValue**(0)) const

  Geometric operation in 2D.

Do it yourself (DIY) operations.

- HxImageRep **diyOp** (**HxString** diyName, **HxTagList** &tags=HxMakeTagList()) const

  DIY operation.

Misc operations

- void **setAt** (const **HxValue** v, int x, int y=0, int z=0)

  setAt is to be removed.

- **HxValue getAt** (int x, int y=0, int z=0) const

  Return pixel value at given position.

- STD_OSTREAM & **printInfo** (STD_OSTREAM &os, int doData=0)

  Print information.

Output/display operations

- void **getRgbPixels2d** (int *pixels, **HxString** displayMode, int resWidth=-1, int resHeight=-1, **HxGeoIntType** gi=NEAREST) const

  The getRgbPixels functions fill an externally allocated buffer(pixels) with pixelvalues of the (2d) image.

- void **getRgbPixels2d** (int *pixels, **HxString** displayMode, int bufWidth, int bufHeight, int VX, int VY, int VW, int VH, double SX, double SY, double scaleX, double scaleY, **HxGeoIntType** gi) const

  Partial display for large images.

- void **getRgbPixels3d** (int *pixels, **HxString** displayMode, int dimension, int coordinate, int resWidth=-1, int resHeight=-1, **HxGeoIntType** gi=NEAREST) const

  Display for 3D images.

For testing purposes only :-)

- **HxImageData** * **dirty** ()
- **HxString ref** () const
- void **setObjectObserver** (const HxObjectObserver &)
- void **setImageDataObserver** (const HxObjectObserver &)

Public Types

- enum **ResultPrecision** { **DEFAULT_PREC**, **SOURCE_PREC**, **ARITH_PREC**, **SMALL_PREC** }

  For some operations a precision needs to be specified.

Static Public Methods

- void **setDefaultResultPrecision** (**ResultPrecision** resPrec)

  Set the value for DEFAULT_PREC.

- **ResultPrecision getResultPrecision** (**ResultPrecision** resPrec=DEFAULT_PREC)

  Get the value for the result precision.

Friends

- class **HxImageFactory**
- class **HxImageRepInit**
- HxImageRep L_HXIMAGEREP **HxProjectRange** (HxImageRep im, int dimension)

  Projection of the pixel range.

- HxImageRep L_HXIMAGEREP **HxInverseProjectRange** (HxImageRep im, int dimension, HxImageRep arg)

  Inverse projection of the pixel range.

- HxImageRep L_HXIMAGEREP **HxRestrict** (HxImageRep img, **HxPoint** begin, **HxPoint** end)

  Restriction of domain.

- HxImageRep L_HXIMAGEREP **HxExtend** (HxImageRep img, HxImageRep background, **HxPoint** begin)

  Extension of domain.

- HxImageRep L_HXIMAGEREP **HxExtendVal** (HxImageRep img, **HxSizes** newSize, **HxValue** background, **HxPoint** begin)

  Extension of domain.

- void L_HXIMAGEREP **HxGetValues** (HxImageRep img, **HxPointListConstIter** first, **HxPointListConstIter** last, **HxValueListBackInserter** valPtr)
- void L_HXIMAGEREP **HxExportMatlabPixels** (HxImageRep img, double *pixels)

  Export image data to array of int.

8.69.1 Detailed Description

Class definition of Horus image representation.

8.69.2 Member Enumeration Documentation

8.69.2.1 enum HxImageRep::ResultPrecision

For some operations a precision needs to be specified.

The type of the result image will be set according to the specified precision:

SOURCE_PREC The result type is the same as the object type. ARITH_PREC The result type is the same as the type of the kernel after the kernel has been converted. SMALL_PREC The result type will be the same as above but with a smaller pixel precision. If the kernel has an integral pixel type the result pixel precision is that of short. If the kernel has a real pixel type the result pixel precision is that of float.

```
239                                     {
240                                 DEFAULT_PREC, SOURCE_PREC,
241                                 ARITH_PREC, SMALL_PREC};
```

8.69.3 Constructor & Destructor Documentation

8.69.3.1 HxImageRep::HxImageRep ()

Null image.

```
126                         : _pointee(0) {
127     if (_objectObserver)
128         _objectObserver->constructed(name());
129 }
```

8.69.3.2 HxImageRep::HxImageRep (const HxImageRep & *rhs*)

Copy constructor.

```
132     : _pointee(rhs.pointee())
133 {
134     if (_objectObserver)
135         _objectObserver->constructed(name());
136 }
```

8.69.3.3 HxImageRep::~HxImageRep ()

Destructor.

```
347 {
348     if (_objectObserver)
349         _objectObserver->destructed(name());
350 }
```

8.69.4 Member Function Documentation

8.69.4.1 HxImageRep & HxImageRep::operator= (const HxImageRep & *rhs*)

Assignment operator.

```
357 {
358     _pointee = rhs._pointee;
359     return *this;
360 }
```

8.69.4.2 int HxImageRep::operator== (const HxImageRep & *arg*) const

Equality.

```
364 {
365     return ident() == arg.ident();
366 }
```

8.69.4.3 int HxImageRep::isNull () const

Indicates wether this is a valid image.

```
370 {
371     return !int(_pointee);
372 }
```

8.69.4.4 HxImageRep::operator int () const

Indicates wether this is a valid image.

```
375 {
376     return int(_pointee);
377 }
```

8.69.4.5 int HxImageRep::ident () const

The unique identifier of the image.

```
384 {
385     return pointee() ? pointee()->ident() : 0;
386 }
```

8.69.4.6 HxString HxImageRep::name () const

The (not necessarily unique) name of the image.

```
390 {
391     return pointee() ? pointee()->name() : HxString("");
392 }
```

8.69.4.7 void HxImageRep::name (HxString *s*)

Sets the name of the image.

```
396 {
397     if (pointee())
398         pointee()->name(s);
399 }
```

8.69.4.8 int HxImageRep::dimensionality () const

The number of dimensions of the image.

```
403 {
404     return pointee() ? pointee()->dimensionality() : 0;
405 }
```

8.69.4.9 int HxImageRep::dimensionSize (int *i*) const

The size of the image in the i-th dimension.

The first dimension has i = 1.

```
409 {
410     return pointee() ? pointee()->dimensionSize(i) : 0;
411 }
```

8.69.4.10 HxSizes HxImageRep::sizes () const

The dimension sizes of the image.

```
445 {
446     return pointee() ? pointee()->sizes() : HxSizes(0, 0, 0);
447 }
```

8.69.4.11 int HxImageRep::numberOfPixels () const

The total number of pixels in the image.

```
415 {
416     return pointee() ? pointee()->numberOfPixels() : 0;
417 }
```

8.69.4.12 int HxImageRep::pixelDimensionality () const

The number of dimensions of one pixel.

```
421 {
422     return pointee() ? pointee()->pixelDimensionality() : 0;
423 }
```

8.69.4.13 HxValueType HxImageRep::pixelType () const

The pixel range value type.

INT_VALUE or REAL_VALUE or COMPLEX_VALUE.

```
427 {
428     return pointee() ? pointee()->pixelType() : INT_VALUE;
429 }
```

8.69.4.14 int HxImageRep::pixelPrecision () const

The pixel size in bits.

If the pixel has more than one dimension the size of a pixel element is returned.

```
433 {
434     return pointee() ? pointee()->pixelPrecision() : 0;
435 }
```

8.69.4.15 HxImageSignature HxImageRep::signature () const

The signature of the image.

```
439 {
440     return pointee() ? pointee()->signature() : HxImageSignature();
441 }
```

8.69.4.16 HxImageRep HxImageRep::unaryPixOp (HxString *upoName*, HxTagList & *tags* = HxMakeTagList()) const

Unary pixel operation.

The result is obtained by applying the pixel functor designated by string ”op” to all pixels in this image.

```
454 {
455     if (!pointee())
456         return HxImageRep();
457     HxMfUpo methodFrame(pointee(), upoName);
458     if (methodFrame.result())
459         methodFrame.result()->unaryPixOp(methodFrame.source(), upoName, tags);
460     return HxImageRep(methodFrame.result());
461 }
```

8.69.4.17 HxImageRep HxImageRep::binaryPixOp (const HxValue *val*, HxString *bpoName*, HxTagList & *tags* = HxMakeTagList()) const

Binary pixel operation.

The result is obtained by applying the pixel functor designated by string ”bpoName” to all pairs of pixels in this image and the argument.

```
486 {
487     if (!pointee())
488         return HxImageRep();
489     HxMfUpo methodFrame(pointee(), bpoName);
490     HxAddTag(tags, "value", val);
491     methodFrame.result()->unaryPixOp(methodFrame.source(), bpoName, tags);
492     return HxImageRep(methodFrame.result());
493 }
```

8.69.4.18 HxImageRep HxImageRep::binaryPixOp (const HxImageRep *arg*, HxString *bpoName*, HxTagList & *tags* = HxMakeTagList()) const

Binary pixel operation.

The result is obtained by applying the pixel functor designated by string ”bpoName” to all pairs of pixels in this image and the argument.

```
498 {
499     if (!pointee())
500         return HxImageRep();
501     HxMfBpo methodFrame(pointee(), arg.pointee(), bpoName);
502     if (methodFrame.preOpIsOk())
503         methodFrame.result()->binaryPixOp(methodFrame.source1(),
504                                 methodFrame.source2(), bpoName, tags);
505     return methodFrame.preOpIsOk()  ? HxImageRep(methodFrame.result())
506                                     : HxImageRep();
507 }
```

8.69.4.19 HxImageRep HxImageRep::multiPixOp (const HxImageList & *args*, HxString *mpoName*, HxTagList & *tags* = HxMakeTagList()) const

Multi pixel operation.

The result is obtained by applying the pixel functor designated by string ”mpoName” to corresponding pixels in this image and all argument images.

```
515 {
516     if (!pointee())
517         return HxImageRep();
518
519     HxImageData **imsPointee = new HxImageData * [args.size()+1];
520     HxImageList::const_iterator i;
521     int n = 0;
522
523     imsPointee[n++] = pointee();
524     for (i = args.begin(); i != args.end(); i++)
525         imsPointee[n++] = (*i).pointee();
526
527     HxMfMpo methodFrame(imsPointee, n, mpoName);
528
529     methodFrame.result()->multiPixOp(methodFrame.sources(),
530                             methodFrame.nSources(), mpoName, tags);
531
532     delete [] imsPointee;
533
534     return HxImageRep(methodFrame.result());
535 }
```

8.69.4.20 HxImageList HxImageRep::MNPixOp (const HxImageList & *args*, HxString *mpoName*, HxTagList & *tags* = HxMakeTagList()) const

M output N input pixel operation.

The results is obtained by applying the pixel functor designated by string ”mpoName” to corresponding pixels in this image and all argument images.

```
543 {
544     if (!pointee())
545         return HxImageRep();
546 
547     typedef HxImageData** HxImgDataPtrArray;
548 
549     HxImageData **srcPtrs = new HxImageData * [args.size()+1];
550     HxImageList::const_iterator i;
551     int srcCnt = 0;
552 
553     srcPtrs[srcCnt++] = pointee();
554     for (i = args.begin(); i != args.end(); i++)
555         srcPtrs[srcCnt++] = (*i).pointee();
556 
557     HxMfMNpo methodFrame(srcPtrs, srcCnt, mpoName);
558 
559     delete [] srcPtrs;
560 
561     HxImageData::MNPixOp(
562         methodFrame.results(), methodFrame.resultCnt(),
563         methodFrame.sources(), methodFrame.sourceCnt(), mpoName, tags);
564 
565     HxImageList result;
566 
567     for (int n = 0; n < methodFrame.resultCnt(); n++) {
568     HxImageRep temp(methodFrame.results(n));
569         result += temp;
570     }
571 
572     return result;
573 }
```

8.69.4.21 void HxImageRep::exportOp (HxString *exportName*, HxTagList & *tags* = HxMakeTagList()) const

Export operation.

```
580 {
581     if (HxImgFtorRuleBase::instance().getIsModifying("inout", exportName))
582     {
583         HxEnvironment::instance()->errorStream()
584             << "Error: " << exportName << " is an image data modifying "
585             << "operator" << STD_ENDL;
586         return;
587     }
588     if (pointee())
589         pointee()->inout(exportName, tags);
590 }
```

8.69.4.22 void HxImageRep::exportOpExtra (HxString *exportName*, HxImageRep *extraIm*, HxTagList & *tags* = HxMakeTagList()) const

Export operation with an extra image.

```
595 {
596     HxMfExportExtra methodFrame(pointee(), extraIm.pointee(), exportName, tags);
597     if (methodFrame.preOpIsOk())
598         methodFrame.source()->exportExtra(exportName, methodFrame.extra(), tags);
599 }
```

8.69.4.23 HxValue HxImageRep::reduceOp (HxString *op*, HxTagList & *tags* = HxMakeTagList()) const

Reduce operation.

The result is obtained by reducing all pixel values in this image to a single value by applying the pixel functor designated by string ”op” repeatedly to a combination of 2 values.

```
603 {
604     exportOp(op, tags);
605     HxValue result = HxGetTag(tags, "result", HxValue(0));
606     return result;
607 }
```

8.69.4.24 void HxImageRep::setDefaultResultPrecision (ResultPrecision *resPrec*) [static]

Set the value for DEFAULT_PREC.

```
43 {
44     _defaultResPrec = resPrec;
45 }
```

8.69.4.25 HxImageRep::ResultPrecision HxImageRep::getResultPrecision (ResultPrecision *resPrec* = DEFAULT_PREC) [static]

Get the value for the result precision.

```
49 {
50     return resPrec == DEFAULT_PREC ? _defaultResPrec : resPrec;
51 }
```

8.69.4.26 HxImageRep HxImageRep::generalizedConvolution (HxImageRep *kernel*, HxString *gMul*, HxString *gAdd*, ResultPrecision *resPrec* = DEFAULT_PREC, HxTagList & *tags* = HxMakeTagList()) const

Generalized convolution operation.

The result is obtained by sliding the kernel over this image and at each position combining the values of the kernel with the underlying values of this image by means of the pixel punctor designated by ”gMul”, and reducing this set of values to a single value by means of the pixel functor designated by ”gAdd”.

```
616 {
617     resPrec = getResultPrecision(resPrec);
618
619     HxMfGenConv methodFrame(pointee(), kernel.pointee(), resPrec);
620     if (methodFrame.preOpIsOk())
621         methodFrame.result()->generalizedConvolution(
622                                 methodFrame.source(),

Geometric operation in 2D.

The result is obtained by applying the given transformation to the position of each pixel in this image. By default, the actual transformation is based on the inverse of the given transformation matrix M: f(x) = M.i() ∗ x (postfix multiplication). Beware that the image coordinate system has a different orientation than the cartesian coordinate system used in specification of matrix M.

The matrix needs to be 3x3 (homogeneous coordinates)

```
847 {
848     if ((func.nCol() != 3) || (func.nRow() != 3))
849         return errorIm("geometricOp2d: matrix needs to be 3x3");

1001 }
```

8.69.4.41 HxValue HxImageRep::getAt (int *x*, int *y* = 0, int *z* = 0) const

Return pixel value at given position.

```
1005 {
1006     return _pointee ? _pointee->getAt(x, y, z) : HxValue(HxScalarInt(0));
1007 }
```

8.69.4.42 STD_OSTREAM & HxImageRep::printInfo (STD_OSTREAM & *os*, int *doData* = 0)

Print information.

```
1011 {
1012     return _pointee ? pointee()->printInfo(os, doData) : os ;
1013 }
```

8.69.4.43 void HxImageRep::getRgbPixels2d (int * *pixels*, HxString *displayMode*, int *resWidth* = -1, int *resHeight* = -1, HxGeoIntType *gi* = NEAREST) const

The getRgbPixels functions fill an externally allocated buffer(pixels) with pixelvalues of the (2d) image.

The values are stored in the buffer according to the format used in Java. Conversion of pixel values in the image to the Java format is done via a HxRgbFunctor (a function object). By default, the size of the pixels buffer matches the image sizes. However, the user may request pixels at a different resolution by giving a resWidth and resHeight. Then, for each pixel in the buffer the value is obtained from the relative position (resWidth is mapped onto the image width, etc.). The value at the relative position is obtained through the given geometric interpolation type gi (and passed to the RgbFunctor). See also: \Ref{Color conversion/display}

8.69.5 Friends And Related Function Documentation

8.69.5.1 HxImageRep L_HXIMAGEREP HxProjectRange (HxImageRep *im*, int *dimension*) [friend]

Projection of the pixel range.

The function computes the projection (see **Pixels** (p. 3)) of all pixels in the input image via a unary pixel operation (see **Images** (p. 8)). Dimension starts at 1.

```
13 {
14     HxString fname("HxProjectRange");
15
16     if (im.isNull())
17     {
18         HxGlobalError::instance()->reportError(fname, im.name(), "null image", HxGlobalError::HX_GE_INV
19         return HxImageRep();
20     }
21     if ((im.pixelDimensionality() != 2) &&
22         (im.pixelDimensionality() != 3))
23     {
24         HxGlobalError::instance()->reportError(fname, "Operation is only valid for Vector images", HxGl
25         return HxImageRep();
26     }
27     if (dimension < 1)
28     {
29         HxGlobalError::instance()->reportError(fname, "Dimension should be greater than zero", HxGlobal
30         return HxImageRep();
31     }
32     if (dimension > im.pixelDimensionality())
33     {
34         HxGlobalError::instance()->reportError(fname, "Dimension should be less than pixel dimensionali
35         return HxImageRep();
36     }
37
38     return im.projectRange(dimension);
39 }
```

8.69.5.2 HxImageRep L_HXIMAGEREP HxInverseProjectRange (HxImageRep *im*, int *dimension*, HxImageRep *arg*) [friend]

Inverse projection of the pixel range.

The function projects (see **Pixels** (p. 3)) all pixels of image im on the given dimension of image arg via a unary pixel operation (see **Images** (p. 8)). Dimension starts at 1.

```
13 {
14     HxString fname("HxInverseProjectRange");
15 
16     if (im.isNull())

8.70 HxImageSeq Class Reference

Class definition for a sequence of **HxImageRep** (p. 620)'s.

```
#include <HxImageSeq.h>
```

Public Methods

- **HxImageSeq** ()

  Constructor.

- **HxImageSeq** (**HxString** filename, int bufSize=0)

  Construct sequence from given file.

- **HxImageSeq** (const HxImageSeq &rhs)

  Copy constructor.

- virtual ~**HxImageSeq** ()

  Destructor.

- HxImageSeq & **operator=** (const HxImageSeq &rhs)

  Assignment operator.

- int **ident** () const

  The identity of the sequence.

- int **isNull** () const

  Indicates wether this is a valid sequence.

- int **frameWidth** () const

  The frame width.

- int **frameHeight** () const

  The frame height.

- int **frameDepth** () const

  The frame depth.

- int **nrFrames** () const

  The number of frames.

- **HxImageRep getFrame** (int nr) const

  Get the specified frame as **HxImageRep** (p. 620).

- void **getRgb2d** (int nr, int *pixels, **HxString** displayMode) const

  Display the specified frame in the given buffer in ARGB format using the given displayMode.

- void **getRgbPixels2d** (int nr, int *pixels, **HxString** displayMode, int resWidth=-1, int resHeight=-1, **HxGeoIntType** gi=NEAREST) const

  Display the specified frame in the given buffer in ARGB format using the given displayMode at the given resolution.

- **HxImageSeqIter begin** ()

  An iterator pointing to the first frame.

- **HxImageSeqIter end** ()

  An iterator pointing beyond the last frame.

- int **writeFile** (std::vector< int > frameList, **HxString** filename, int format)

  Write the frame from the list to the given file in the given format.

- STD_OSTREAM & **put** (STD_OSTREAM &os) const

  Put some information on the given stream.

Static Public Methods

- void **setUseMDC** (int flag)

  Indicate whether the MDC library should be used to decode mpeg files (when it is available :-).

Static Public Attributes

- const int **MPEG_F** = 1
- const int **MIR_F** = 2
- const int **AVI_F** = 3

Friends

- class **HxImageSeqIter**

8.70.1 Detailed Description

Class definition for a sequence of **HxImageRep** (p. 620)'s.

Supported types:

- Mpeg video: Both Mpeg 1 and 2 are supported.
- MIR video: A simple uncompressed format. A sequence of images (**HxImageRep** (p. 620)) are stacked in a MIR file. MIR stands for Motion (Hx)ImageRep.
- AVI video: Standard video for windows format.

We use the file extension to recognize the video format:

- .mir -> MIR format
- .avi -> AVI format
- default -> Mpeg format

8.70.2 Constructor & Destructor Documentation

8.70.2.1 HxImageSeq::HxImageSeq ()

Constructor.

```
31                          : _pointee(0)
32 {
33 }
```

8.70.2.2 HxImageSeq::HxImageSeq (HxString *filename*, int *bufSize* = 0)

Construct sequence from given file.

bufSize: the size of the internal buffer. The buffer stores frames converted to **HxImageRep** (p. 620)'s for later references. In the current implementation only contiguous frames are kept. The default is no buffering.

```
35                                                          : _pointee(0)
36 {
37 #ifndef __GNUC__
38     int pos = filename.rfind(".");
39     if (pos >=0 ) {
40         HxString ext = filename.substr(pos);
41         for (HxString::iterator i = ext.begin(); i!= ext.end(); i++)
42             *i = toupper(*i);
43         if (ext.compare(".MIR")==0)
44             _pointee = new HxImageSeqMir(filename, bufSize);
45         else {
46             HxImageSeqData* seq;
47             if (_useMDC)
48                 seq = new HxImageSeqMDC(filename, bufSize);
49             else
50                 seq = new HxImageSeqDXMedia(filename, bufSize);
51             if(seq->valid())
52                 _pointee = seq;
53             else
54                 delete seq;
55         }
56     } else {
57         HxEnvironment::instance()->errorStream()
58             << "No extension found in " << filename << STD_ENDL;
59         HxEnvironment::instance()->flush();
60     }
61 #else
62     HxImageSeqMDC* seq = new HxImageSeqMDC(filename, bufSize);
63     if(seq->valid())
64         _pointee = seq;
65     else
66         delete seq;
67 #endif
68 }
```

8.70.2.3 HxImageSeq::HxImageSeq (const HxImageSeq & *rhs*)

Copy constructor.

```
76                                              : _pointee(rhs.pointee())
77 {
78 }
```

8.70.2.4 HxImageSeq::~HxImageSeq () [virtual]

Destructor.

```
81 {
82 }
```

8.70.3 Member Function Documentation

8.70.3.1 void HxImageSeq::setUseMDC (int *flag*) [static]

Indicate whether the MDC library should be used to decode mpeg files (when it is available :-).

Default is false.

```
72 {
73     _useMDC = flag;
74 }
```

8.70.3.2 HxImageSeq & HxImageSeq::operator= (const HxImageSeq & *rhs*)

Assignment operator.

```
86 {
87     _pointee = rhs._pointee;
88     return *this;
89 }
```

8.70.3.3 int HxImageSeq::ident () const

The identity of the sequence.

```
99 {
100     return pointee() ? pointee()->ident() : 0;
101 }
```

8.70.3.4 int HxImageSeq::isNull () const

Indicates wether this is a valid sequence.

```
93 {
94     return !int(_pointee);
95 }
```

8.70.3.5 int HxImageSeq::frameWidth () const

The frame width.

```
105 {
106     return pointee() ? pointee()->frameWidth() : 0;
107 }
```

8.70.3.6 int HxImageSeq::frameHeight () const

The frame height.

```
111 {
112     return pointee() ? pointee()->frameHeight() : 0;
113 }
```

8.70.3.7 int HxImageSeq::frameDepth () const

The frame depth.

```
117 {
118     return pointee() ? pointee()->frameDepth() : 0;
119 }
```

8.70.3.8 int HxImageSeq::nrFrames () const

The number of frames.

```
123 {
124     return pointee() ? pointee()->nrFrames() : 0;
125 }
```

8.70.3.9 HxImageRep HxImageSeq::getFrame (int *nr*) const

Get the specified frame as **HxImageRep** (p. 620).

```
129 {
130     return pointee() ? pointee()->getFrame(nr) : HxImageRep();
131 }
```

8.70.3.10 void HxImageSeq::getRgb2d (int *nr*, int * *pixels*, HxString *displayMode*) const

Display the specified frame in the given buffer in ARGB format using the given displayMode.

The pixels buffer has to be allocated by the class user and should have sufficient size.

```
135 {
136     if (!pointee()) return;
137
138     pointee()->getRgb2d(nr, pixels, displayMode);
139 }
```

8.70.3.11 void HxImageSeq::getRgbPixels2d (int *nr*, int * *pixels*, HxString *displayMode*, int *resWidth* = -1, int *resHeight* = -1, HxGeoIntType *gi* = NEAREST) const

Display the specified frame in the given buffer in ARGB format using the given displayMode at the given resolution.

The pixels buffer has to be allocated by the class user and should have sufficient size.

```
144 {
145     if (!pointee()) return;
146 
147     pointee()->getRgbPixels2d(nr, pixels, displayMode, resWidth, resHeight, gi);
148 }
```

8.70.3.12 HxImageSeqIter HxImageSeq::begin ()

An iterator pointing to the first frame.

```
152 {
153     return HxImageSeqIter(this, 0);
154 }
```

8.70.3.13 HxImageSeqIter HxImageSeq::end ()

An iterator pointing beyond the last frame.

```
158 {
159     return HxImageSeqIter(this, pointee()->nrFrames());
160 }
```

8.70.3.14 int HxImageSeq::writeFile (std::vector< int > *frameList*, HxString *filename*, int *format*)

Write the frame from the list to the given file in the given format.

Currently, only MIR format is implemented.

```
164 {
165 
166 #ifndef __GNUC__
167 
168     if (format==MIR_F) {
169         Header_Type* header = new Header_Type;

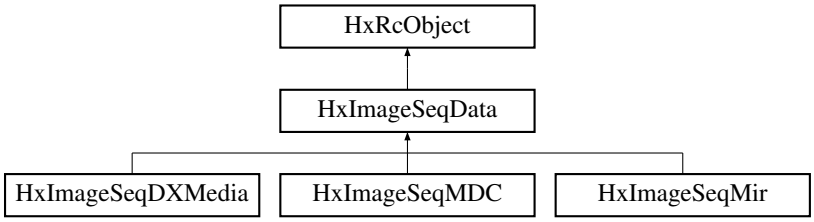
8.71 HxImageSeqData Class Reference

Base class for storage of image sequence data.

`#include <HxImageSeqData.h>`

Inheritance diagram for HxImageSeqData::



Public Methods

- **HxImageSeqData** (int bufsize)
  Constructor.
- virtual ~**HxImageSeqData** ()
  Destructor.
- int **ident** () const
  The identity of the sequence.
- virtual int **valid** ()=0
  Is this a valid object?
- virtual int **frameWidth** ()=0
  The frame width.
- virtual int **frameHeight** ()=0
  The frame height.
- virtual int **frameDepth** ()=0
  The frame depth.
- virtual int **nrFrames** ()=0
  The number of frames.
- **HxImageRep getFrame** (int fn)
  Get the specified frame.
- virtual void **getRgb2d** (int fn, int *pixels, **HxString** displayMode)
  Displays the specified frame in the buffer by calling getRgbPixels2d of the **HxImageRep** (p. 620) *corresponding to the given frame number.*
- virtual void **getRgbPixels2d** (int nr, int *pixels, **HxString** displayMode, int resWidth, int resHeight, **HxGeoIntType** gi)
  Displays the specified frame in the buffer by calling getRgbPixels2d of the **HxImageRep** (p. 620) *corresponding to the given frame number.*
- virtual **HxImageRep frame2HxImageRep** (int)=0
  "construct" an **HxImageRep** (p. 620) *for the specified frame.*

8.71.1 Detailed Description

Base class for storage of image sequence data.

The actual (pixel) data is read by specializations of this class. For that purpose, specializations have to implement the function frame2HxImageRep. The specializations also have to implement inquiry functions to provide information about image dimensions and the number of frames in the sequence.

The main purpose of this class is to provide a buffering mechanism for **HxImageRep** (p. 620)'s of the sequence as we expect processing of such a sequence will be done in a small sliding window so multiple requests for the same frame will occur.

This class also provides a default implementation

8.71.2 Constructor & Destructor Documentation

8.71.2.1 HxImageSeqData::HxImageSeqData (int *bufsize*)

Constructor.

```
21 {
22     _ident = _nr++;
23     // if == INT_MAX
24     _bufsize = bufsize;
25     _current = -1;
26     _size = 0; // nothing in the buffer
27     _buffer.clear();
28 }
```

8.71.2.2 HxImageSeqData::~HxImageSeqData () [virtual]

Destructor.

```
31 {
32     _buffer.clear();
33 }
```

8.71.3 Member Function Documentation

8.71.3.1 int HxImageSeqData::ident () const

The identity of the sequence.

```
83 {
84     return _ident;
85 }
```

8.71.3.2 virtual int HxImageSeqData::valid () [pure virtual]

Is this a valid object?

Reimplemented in **HxImageSeqDXMedia** (p. 659), and **HxImageSeqMDC** (p. 667).

8.71.3.3 virtual int HxImageSeqData::frameWidth () [pure virtual]

The frame width.

Reimplemented in **HxImageSeqDXMedia** (p. 659), and **HxImageSeqMDC** (p. 667).

8.71.3.4 virtual int HxImageSeqData::frameHeight () [pure virtual]

The frame height.

Reimplemented in **HxImageSeqDXMedia** (p. 660), and **HxImageSeqMDC** (p. 668).

8.71.3.5 virtual int HxImageSeqData::frameDepth () [pure virtual]

The frame depth.

Reimplemented in **HxImageSeqDXMedia** (p. 660), and **HxImageSeqMDC** (p. 668).

8.71.3.6 virtual int HxImageSeqData::nrFrames () [pure virtual]

The number of frames.

Reimplemented in **HxImageSeqDXMedia** (p. 660), and **HxImageSeqMDC** (p. 668).

8.71.3.7 HxImageRep HxImageSeqData::getFrame (int *fn*)

Get the specified frame.

```
37 {
38     if (_bufsize <= 0) // we are not buffering
39         return frame2HxImageRep(fn);
40 
41     if (fn == _current+1) {
42         HxImageRep tmp = frame2HxImageRep(fn);
43         if (_size < _bufsize) {
44             _size++;
45         } else {
46             _buffer.pop_back();
47         }

64     return tmp;
65 }
```

8.71.3.8 void HxImageSeqData::getRgb2d (int *fn*, int * *pixels*, HxString *displayMode*) [virtual]

Displays the specified frame in the buffer by calling getRgbPixels2d of the **HxImageRep** (p. 620) corresponding to the given frame number.

Reimplemented in **HxImageSeqDXMedia** (p. 660), and **HxImageSeqMDC** (p. 668).

```
69 {
70     HxImageRep frame = getFrame(fn);
71     frame.getRgbPixels2d(pixels, displayMode);
72 }
```

8.71.3.9 void HxImageSeqData::getRgbPixels2d (int *fn*, int * *pixels*, HxString *displayMode*, int *resWidth*, int *resHeight*, HxGeoIntType *gi*) [virtual]

Displays the specified frame in the buffer by calling getRgbPixels2d of the **HxImageRep** (p. 620) corresponding to the given frame number.

Reimplemented in **HxImageSeqDXMedia** (p. 660), and **HxImageSeqMDC** (p. 668).

```
77 {
78     HxImageRep frame = getFrame(fn);
79     frame.getRgbPixels2d(pixels, displayMode, resWidth, resHeight, gi);
80 }
```

8.71.3.10 virtual HxImageRep HxImageSeqData::frame2HxImageRep (int *fn*) [pure virtual]

"construct" an **HxImageRep** (p. 620) for the specified frame.

Derived classes are to implement this function to deliver the actual image data.

Reimplemented in **HxImageSeqDXMedia** (p. 661), and **HxImageSeqMDC** (p. 669).

The documentation for this class was generated from the following files:

- **HxImageSeqData.h**
- HxImageSeqData.c

8.72.1 Detailed Description

Read image sequence files using DirectMedia library.

8.72.2 Constructor & Destructor Documentation

8.72.2.1 HxImageSeqDXMedia::HxImageSeqDXMedia (HxString *fileName*, int *bufSize*)

Constructor.

```
20     : HxImageSeqData(bufSize)
21 {
22     _handle = HxDXLoadVideo(fileName.c_str());
23     if (_handle) {
24         _sizes = HxSizes(frameWidth(), frameHeight(), 1);
25     } else {
26         HxEnvironment::instance()->errorStream() <<
27             "HxImageSeqDXMedia : unable to load file " << fileName << STD_ENDL;
28         HxEnvironment::instance()->flush();
29     }
30 }
```

8.72.2.2 HxImageSeqDXMedia::~HxImageSeqDXMedia () [virtual]

Destructor.

```
39 {
40     if (_handle)
41     {
42         HxDXCloseVideo(_handle);
43     }
44 }
```

8.72.3 Member Function Documentation

8.72.3.1 int HxImageSeqDXMedia::valid () [virtual]

Is this a valid object?

Reimplemented from **HxImageSeqData** (p. 655).

```
34 {
35     return (_handle != NULL);
36 }
```

8.72.3.2 int HxImageSeqDXMedia::frameWidth () [virtual]

The frame width.

Reimplemented from **HxImageSeqData** (p. 656).

```
48 {
49     return (_handle) ? HxDXGetFrameWidth(_handle) : -1;
50 }
```

8.72.3.3 int HxImageSeqDXMedia::frameHeight () [virtual]

The frame height.

Reimplemented from **HxImageSeqData** (p. 656).

```
54 {
55     return (_handle) ? HxDXGetFrameHeight(_handle) : -1;
56 }
```

8.72.3.4 int HxImageSeqDXMedia::frameDepth () [virtual]

The frame depth.

Reimplemented from **HxImageSeqData** (p. 656).

```
60 {
61     return 1;
62 }
```

8.72.3.5 int HxImageSeqDXMedia::nrFrames () [virtual]

The number of frames.

Reimplemented from **HxImageSeqData** (p. 656).

```
66 {
67     return (_handle) ? HxDXGetLength(_handle) : 0;
68 }
```

8.72.3.6 void HxImageSeqDXMedia::getRgb2d (int *fn*, int * *pixels*, HxString *displayMode*) [virtual]

Display the specified frame in the given buffer in ARGB format using the given displayMode.

Optimized version : does not require **HxImageRep** (p. 620).

Reimplemented from **HxImageSeqData** (p. 657).

```
85 {
86     if(!_handle) return;
87
88     if(displayMode == "Direct") getRgbPixels2d(fn, pixels);
89     else
90         HxImageSeqData::getRgb2d(fn, pixels, displayMode);
91 }
```

8.72.3.7 void HxImageSeqDXMedia::getRgbPixels2d (int *fn*, int * *pixels*, HxString *displayMode*, int *resWidth*, int *resHeight*, HxGeoIntType *gi*) [virtual]

Display the specified frame in the given buffer in ARGB format using the given displayMode.

Optimized version : does not require **HxImageRep** (p. 620).

Reimplemented from **HxImageSeqData** (p. 657).

```
73 {
74     if(!_handle) return;
75
76     if((displayMode == "Direct") && (resWidth == -1) && (resHeight == -1))
77         getRgbPixels2d(fn, pixels);
78     else
79         HxImageSeqData::getRgbPixels2d(fn, pixels, displayMode,
80             resWidth, resHeight, gi);
81 }
```

8.72.3.8 HxImageRep HxImageSeqDXMedia::frame2HxImageRep (int *fn*) [virtual]

"construct" an **HxImageRep** (p. 620) for the specified frame.

Reimplemented from **HxImageSeqData** (p. 657).

```
113 {
114     HxImageSignature sig(2, 3, INT_VALUE, 8);
115     unsigned char* data = HxDXGetFrame(_handle, fn);
116     if (data) {
117         //HxTagList tags;
118         //HxAddTag(tags, "dataPtr", data);
119         //return HxImageFactory::instance().fromImport(sig, _sizes,
120         //  "importBgr", tags);
121
122         HxImageRep im = HxMakeFromByteData(3, 2, _sizes, data);
123         return im;
124     }
125     HxImageRep im2 = HxMakeFromSignature(sig, _sizes);
126     return im2;
127 }
```

- **HxImageSig2dComplex** ()

8.76.1 Detailed Description

Signature for a 2D image with pixels represented by an **HxComplex** (p. 506).

The documentation for this class was generated from the following file:

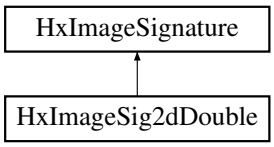
- **HxImageSig2dComplex.h**

8.77 HxImageSig2dDouble Class Reference

Signature for a 2D image with pixels represented by a double.

`#include <HxImageSig2dDouble.h>`

Inheritance diagram for HxImageSig2dDouble::



Public Types

- typedef double **PixelType**
- typedef **HxScalarDouble ArithType**
- typedef **HxScalarDouble ArithTypeDouble**
- typedef **HxDataPtr2dScalarTem**< PixelType, ArithType > **DataPtrType**
- typedef **HxPixelAllocator**< PixelType > **Allocator**
- typedef HxImageSig2dDouble **ProjectDomainImageSigType**
- typedef HxImageSig2dDouble **ArithImageSigType**
- typedef HxImageSig2dDouble **ArithImageSigTypeDouble**
- enum { **ID** = SIG_ID(2, 1, REAL_VALUE, sizeof(PixelType) << 3) }

Public Methods

- **HxImageSig2dDouble** ()

8.77.1 Detailed Description

Signature for a 2D image with pixels represented by a double.

The documentation for this class was generated from the following file:

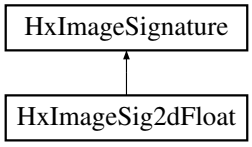
- **HxImageSig2dDouble.h**

8.78 HxImageSig2dFloat Class Reference

Signature for a 2D image with pixels represented by a float.

`#include <HxImageSig2dFloat.h>`

Inheritance diagram for HxImageSig2dFloat::



Public Types

- typedef float **PixelType**
- typedef **HxScalarDouble ArithType**
- typedef **HxScalarDouble ArithTypeDouble**
- typedef **HxDataPtr2dScalarTem**< PixelType, ArithType > **DataPtrType**
- typedef **HxPixelAllocator**< PixelType > **Allocator**
- typedef HxImageSig2dFloat **ProjectDomainImageSigType**
- typedef **HxImageSig2dDouble ArithImageSigType**
- typedef **HxImageSig2dDouble ArithImageSigTypeDouble**
- enum { **ID** = SIG_ID(2, 1, REAL_VALUE, sizeof(float) << 3) }

Public Methods

- **HxImageSig2dFloat** ()

8.78.1 Detailed Description

Signature for a 2D image with pixels represented by a float.

The documentation for this class was generated from the following file:

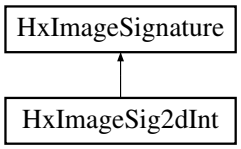
- **HxImageSig2dFloat.h**

8.79 HxImageSig2dInt Class Reference

Signature for a 2D image with pixels represented by an int.

`#include <HxImageSig2dInt.h>`

Inheritance diagram for HxImageSig2dInt::



Public Types

- typedef int **PixelType**
- typedef **HxScalarInt ArithType**
- typedef **HxScalarDouble ArithTypeDouble**
- typedef **HxDataPtr2dScalarTem**< PixelType, ArithType > **DataPtrType**
- typedef **HxPixelAllocator**< PixelType > **Allocator**
- typedef HxImageSig2dInt **ProjectDomainImageSigType**
- typedef HxImageSig2dInt **ArithImageSigType**
- typedef **HxImageSig2dDouble ArithImageSigTypeDouble**
- enum { **ID** = SIG_ID(2, 1, INT_VALUE, sizeof(PixelType) << 3) }

Public Methods

- **HxImageSig2dInt** ()

8.79.1 Detailed Description

Signature for a 2D image with pixels represented by an int.

The documentation for this class was generated from the following file:

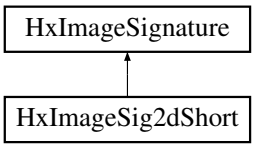
- **HxImageSig2dInt.h**

8.80 HxImageSig2dShort Class Reference

Signature for a 2D image with pixels represented by a short.

`#include <HxImageSig2dShort.h>`

Inheritance diagram for HxImageSig2dShort::



Public Types

- typedef short **PixelType**
- typedef **HxScalarInt ArithType**
- typedef **HxScalarDouble ArithTypeDouble**
- typedef **HxDataPtr2dScalarTem**< PixelType, ArithType > **DataPtrType**
- typedef **HxPixelAllocator**< PixelType > **Allocator**
- typedef HxImageSig2dShort **ProjectDomainImageSigType**
- typedef **HxImageSig2dInt ArithImageSigType**
- typedef **HxImageSig2dDouble ArithImageSigTypeDouble**
- enum { **ID** = SIG_ID(2, 1, INT_VALUE, sizeof(PixelType) << 3) }

Public Methods

- **HxImageSig2dShort** ()

8.80.1 Detailed Description

Signature for a 2D image with pixels represented by a short.

The documentation for this class was generated from the following file:

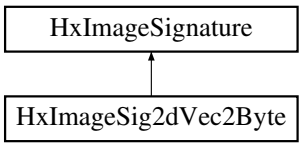
- **HxImageSig2dShort.h**

8.81 HxImageSig2dVec2Byte Class Reference

Signature for a 2D image with pixels represented by an HxVec2Byte.

`#include <HxImageSig2dVec2Byte.h>`

Inheritance diagram for HxImageSig2dVec2Byte::



Public Types

- typedef **HxVec2Byte PixelType**
- typedef **HxVec2Int ArithType**
- typedef **HxVec2Double ArithTypeDouble**
- typedef **HxDataPtr2dTem**< PixelType, ArithType > **DataPtrType**

8.95.1 Detailed Description

Signature for a 3D image with pixels represented by a short.

The documentation for this class was generated from the following file:

- **HxImageSig3dShort.h**

8.96 HxImageSignature Class Reference

Class definition image signature.

`#include <HxImageSignature.h>`

Inheritance diagram for HxImageSignature::

Constructors

- **HxImageSignature** ()

  Default constructor.

- **HxImageSignature** (const HxImageSignature &)

  Copy constructor.

- **HxImageSignature** (int imageDimensionality, int pixelDimensionality, **HxValueType** pixelType, int pixelPrecision)

  Construct signature with given description.

Operators

- HxImageSignature & **operator=** (const HxImageSignature &)

  Assignment operator.

- bool **isEqual** (const HxImageSignature &) const

  Equality for signatures.

- HxImageSignature **broadest** (const HxImageSignature &) const

  Broadest signature.

- bool **operator==** (const HxImageSignature &) const

  Equal.

- int **operator!=** (const HxImageSignature &) const

  Not equal.

- bool **operator**< (const HxImageSignature &) const

  Smaller.

Inquiry

- int **imageDimensionality** () const

  The dimensionality of the image (1, 2, or 3).

- int **pixelDimensionality** () const

  The dimensionality of the pixel values in the image (1: scalar value, 2: vector of 2 scalars, 3: vector of 3 scalars).

- **HxValueType pixelType** () const

  The type of the pixel values.

- int **pixelPrecision** () const

  The number of bits used in the representation of a pixel value (8, 16, 32, or 64).

Modification

- void **setImageDimensionality** (int)

  Set the image dimensionality.

- void **setPixelDimensionality** (int)

  Set the dimensionality of the pixel values.

- void **setPixelType** (**HxValueType**)

  Set the type of the pixel values.

- void **setPixelPrecision** (int)

  Set the number of bits used in the representation.

Output

- virtual STD_OSTREAM & **put** (STD_OSTREAM &) const

  Print value on stream.

- virtual **HxString toString** () const

  Value as a string.

- HxImageSignature **NameToSignature** (**HxString** name)

  Make signature from name.

Public Methods

- int **ident** () const

Protected Attributes

- int **_imageDimensionality**
- int **_pixelDimensionality**
- **HxValueType _pixelType**
- int **_pixelPrecision**

8.96.1 Detailed Description

Class definition image signature.

The signature gives a description of the characteristics of an image type (class).

8.96.2 Constructor & Destructor Documentation

8.96.2.1 HxImageSignature::HxImageSignature () [inline]

Default constructor.

```
203 {
204     _imageDimensionality = 2;
205     _pixelDimensionality = 1;
206     _pixelType = INT_VALUE;
207     _pixelPrecision = sizeof(short) << 3;
208 }
```

8.96.2.2 HxImageSignature::HxImageSignature (const HxImageSignature & *rhs*) [inline]

Copy constructor.

```
222     :   _imageDimensionality(rhs._imageDimensionality),
223         _pixelDimensionality(rhs._pixelDimensionality),
224         _pixelType(rhs._pixelType),
225         _pixelPrecision(rhs._pixelPrecision)
226 {
227 }
```

8.96.2.3 HxImageSignature::HxImageSignature (int *imgDim*, int *pixDim*, HxValueType *pixType*, int *pixPrec*) [inline]

Construct signature with given description.

```
213 {
214     _imageDimensionality = imgDim;
215     _pixelDimensionality = pixDim;
216     _pixelType = pixType;
217     _pixelPrecision = pixPrec;
218 }
```

8.96.3 Member Function Documentation

8.96.3.1 HxImageSignature & HxImageSignature::operator= (const HxImageSignature & *rhs*) [inline]

Assignment operator.

```
232 {
233     _imageDimensionality = rhs._imageDimensionality;
234     _pixelDimensionality = rhs._pixelDimensionality;
235     _pixelType = rhs._pixelType;
236     _pixelPrecision = rhs._pixelPrecision;
237     return *this;
238 }
```

8.96.3.2 bool HxImageSignature::isEqual (const HxImageSignature & *sig2*) const

Equality for signatures.

Same as operator==

```
126 {
127     if (_imageDimensionality != sig2._imageDimensionality)
128         return false;
129     if (_pixelDimensionality != sig2._pixelDimensionality)
130         return false;
131     if (_pixelType != sig2._pixelType)
132         return false;
133     if (_pixelPrecision != sig2._pixelPrecision)
134         return false;
135     return true;
136 }
```

8.96.3.3 HxImageSignature HxImageSignature::broadest (const HxImageSignature & *sig2*) const

Broadest signature.

Defined as the ”piecewise max” where max of integer and real equals real. In case one of the arguments has a pixel value type integer and the broadest signature has a pixel type real then the pixel precision of the result is doubled before computing the max to compensate for the loss of precision that occurs when integers are represented as floating point values.

```
158 {
159     HxImageSignature m;
160 
161     m._imageDimensionality = std::max(  _imageDimensionality,
162                                         sig2._imageDimensionality);
163     m._pixelDimensionality = std::max(  _pixelDimensionality,
164                                         sig2._pixelDimensionality);
165     m._pixelType = std::max(    _pixelType,
166                                 sig2._pixelType);
167 
168     int p1 = _pixelPrecision;
169     int p2 = sig2._pixelPrecision;
170     if ((m._pixelType == REAL_VALUE) || (m._pixelType == COMPLEX_VALUE))
171     {
172         if (_pixelType == INT_VALUE)
173             p1 = ((p1 << 1) <= doubleSize) ? (p1 << 1) : p1;
174         if (sig2._pixelType == INT_VALUE)
175             p2 = ((p2 << 1) <= doubleSize) ? (p2 << 1) : p2;
176     }
177     m._pixelPrecision = std::max(p1, p2);
178 
179     return m;
180 }
```

8.96.3.4 bool HxImageSignature::operator== (const HxImageSignature & *rhs*) const [inline]

Equal.

```
290 {
291     return isEqual(rhs);
292 }
```

8.96.3.5 int HxImageSignature::operator!= (const HxImageSignature & *rhs*) const [inline]

Not equal.

```
296 {
297     return !isEqual(rhs);
298 }
```

8.96.3.6 bool HxImageSignature::operator< (const HxImageSignature & *sig2*) const

Smaller.

Only for sorting purposes!

```
140 {
141     if (_imageDimensionality < sig2._imageDimensionality)
142         return true;
143     if (_imageDimensionality > sig2._imageDimensionality)
144         return false;
145     if (_pixelDimensionality < sig2._pixelDimensionality)
146         return true;
147     if (_pixelDimensionality > sig2._pixelDimensionality)
148         return false;
149     if (_pixelType < sig2._pixelType)
```

```
150         return true;
151     if (_pixelType > sig2._pixelType)
152         return false;
153     return (_pixelPrecision < sig2._pixelPrecision);
154 }
```

8.96.3.7 int HxImageSignature::imageDimensionality () const [inline]

The dimensionality of the image (1, 2, or 3).

```
242 {
243     return _imageDimensionality;
244 }
```

8.96.3.8 int HxImageSignature::pixelDimensionality () const [inline]

The dimensionality of the pixel values in the image (1: scalar value, 2: vector of 2 scalars, 3: vector of 3 scalars).

```
248 {
249     return _pixelDimensionality;
250 }
```

8.96.3.9 HxValueType HxImageSignature::pixelType () const [inline]

The type of the pixel values.

```
254 {
255     return _pixelType;
256 }
```

8.96.3.10 int HxImageSignature::pixelPrecision () const [inline]

The number of bits used in the representation of a pixel value (8, 16, 32, or 64).

```
260 {
261     return _pixelPrecision;
262 }
```

8.96.3.11 void HxImageSignature::setImageDimensionality (int *i*) [inline]

Set the image dimensionality.

```
266 {
267     _imageDimensionality = i;
268 }
```

8.96.3.12 void HxImageSignature::setPixelDimensionality (int *i*) [inline]

Set the dimensionality of the pixel values.

```
272 {
273     _pixelDimensionality = i;
274 }
```

8.96.3.13 void HxImageSignature::setPixelType (HxValueType *t*) [inline]

Set the type of the pixel values.

```
278 {
279     _pixelType = t;
280 }
```

8.96.3.14 void HxImageSignature::setPixelPrecision (int *i*) [inline]

Set the number of bits used in the representation.

```
284 {
285     _pixelPrecision = i;
286 }
```

8.96.3.15 STD_OSTREAM & HxImageSignature::put (STD_OSTREAM & *os*) const [virtual]

Print value on stream.

For global operator<<

```
191 {
192     os << "Image" << imageDimensionality() << "d";
193     if ((pixelDimensionality() > 1) && (pixelType() != COMPLEX_VALUE))
194         os << "Vec" << pixelDimensionality();
195     switch (pixelType()) {
196     case INT_VALUE:
197         os << "Int";
198         break;
199     case REAL_VALUE:
200         os << "Real";
201         break;
202     case COMPLEX_VALUE:
203         os << "Complex";
204         break;
205     }
206     os << pixelPrecision();
207     return os;
208 }
```

8.96.3.16 HxString HxImageSignature::toString () const [virtual]

Value as a string.

```
212 {
213     HxString s("Image");
214     s += makeString(imageDimensionality()) + "d";
215     if ((pixelDimensionality() > 1) && (pixelType() != COMPLEX_VALUE))
216         s += "Vec" + makeString(pixelDimensionality());
217     switch (pixelType()) {
218     case INT_VALUE:
219         s += "Int";
220         break;
221     case REAL_VALUE:
222         s += "Real";
223         break;
224     case COMPLEX_VALUE:
225         s += "Complex";
226         break;
227     }
228     s += makeString(pixelPrecision());
229     return s;
230 }
```

8.96.3.17 HxImageSignature HxImageSignature::NameToSignature (HxString *name*) [static]

Make signature from name.

```
271 {
272     static bool init = SignatureMapInit();
273     SignatureMap::iterator p = signatureMap.find(name);
274     return (p != signatureMap.end()) ?
275             (*p).second :
276             HxImageSignature(2, 1, INT_VALUE, 8);
277 }
```

8.97.1 Detailed Description

template<class ImageSigT> class HxImageTem< ImageSigT >

Template class for operations that are independent of image dimensionality.

8.97.2 Member Function Documentation

8.97.2.1 template<class ImageSigT> int HxImageTem< ImageSigT >::dimensionality () const [virtual]

Get dimensionality.

Reimplemented from **HxImageData** (p. 588).

```
46 {
47     return ImageSigT().imageDimensionality();
48 }
```

8.97.2.2 template<class ImageSigT> int HxImageTem< ImageSigT >::dimensionSize (int *i*) const [virtual]

Get image size in given dimension.

Reimplemented from **HxImageData** (p. 588).

```
53 {
54     return ((i<1) || (i>dimensionality())) ? 1 : _dimSizes[i-1];
55 }
```

8.97.2.3 template<class ImageSigT> HxSizes HxImageTem< ImageSigT >::sizes () const [virtual]

Get image sizes.

Reimplemented from **HxImageData** (p. 589).

```
60 {
61     return HxSizes(_dimSizes[0], _dimSizes[1], _dimSizes[2]);
62 }
```

8.97.2.4 template<class ImageSigT> int HxImageTem< ImageSigT >::numberOfPixels () const [virtual]

Get total number of pixels.

Reimplemented from **HxImageData** (p. 589).

```
67 {
68     int dim = dimensionality();
69     int nPix = 1;
70     for (int i=1 ; i<=dim ; i++)
71         nPix *= dimensionSize(i);
72     return nPix;
73 }
```

8.97.2.5 template<class ImageSigT> int HxImageTem< ImageSigT >::pixelDimensionality () const [virtual]

Get dimensionality of pixels.

Reimplemented from **HxImageData** (p. 589).

```
78 {
79     return ImageSigT().pixelDimensionality();
80 }
```

8.97.2.6 template<class ImageSigT> HxValueType HxImageTem< ImageSigT >::pixelType () const [virtual]

Get type of pixel.

Reimplemented from **HxImageData** (p. 589).

```
85 {
86     return ImageSigT().pixelType();
87 }
```

8.97.2.7 template<class ImageSigT> int HxImageTem< ImageSigT >::pixelPrecision () const [virtual]

Get pixel precision.

Reimplemented from **HxImageData** (p. 589).

```
92 {
93     return ImageSigT().pixelPrecision();
94 }
```

8.97.2.8 template<class ImageSigT> HxImageSignature HxImageTem< ImageSigT >::signature () const [virtual]

Get image signature.

Reimplemented from **HxImageData** (p. 589).

```
99 {
100     return ImageSigT();
101 }
```

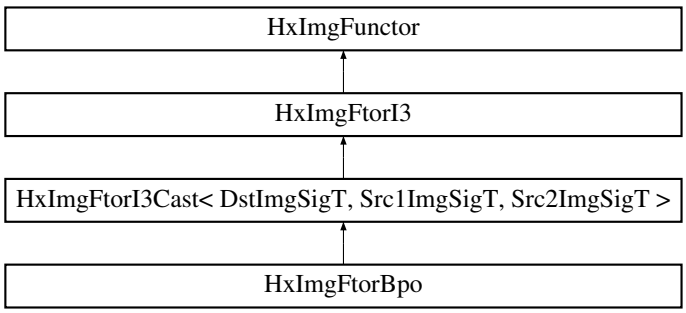
8.100 HxImgFtorBpo Class Template Reference

Instantiation of generic algorithm for binary pixel operations on images.

`#include <HxImgFtorBpo.h>`

Inheritance diagram for HxImgFtorBpo::



Public Types

- typedef **HxImgFtorBpoKey KeyType**

  The key type of this class.

- enum **RuleType** { **Src1IsKey**, **ArgsAreKey** }

The type of the rule to insert in the rule base.

Public Methods

- **HxImgFtorBpo** (**RuleType** ruleType=Src1IsKey)

  Constructor.

- virtual ~**HxImgFtorBpo** ()

  Destructor.

Protected Methods

- virtual void **doIt** (**Img1DataPtrType** dstPtr, **Img2DataPtrType** src1Ptr, **Img3DataPtrType** src2Ptr, **HxSizes** dstSize, **HxSizes** src1Size, **HxSizes** src2Size, **HxTagList** &tags, **HxImgFtorDescription** *description=0)

  Calls **HxFuncBpoDispatch** (p. 153) *to do the actual work.*

8.100.1 Detailed Description

template<class DstImgSigT, class Src1ImgSigT, class Src2ImgSigT, class BpoT> class HxImgFtorBpo< DstImgSigT, Src1ImgSigT, Src2ImgSigT, BpoT >

Instantiation of generic algorithm for binary pixel operations on images.

Template parameters:

- DstImgSigT is the signature type of the destination image
- Src1ImgSigT is the signature type of the first source image
- Src2ImgSigT is the signature type of the second source image
- BpoT is the type of the pixel functor

8.100.2 Member Typedef Documentation

8.100.2.1 template<class DstImgSigT, class Src1ImgSigT, class Src2ImgSigT, class BpoT> typedef HxImgFtorBpoKey HxImgFtorBpo::KeyType

The key type of this class.

Reimplemented from **HxImgFtorI3Cast** (p. 761).

8.100.3 Member Enumeration Documentation

8.100.3.1 template<class DstImgSigT, class Src1ImgSigT, class Src2ImgSigT, class BpoT> enum HxImgFtorBpo::RuleType

The type of the rule to insert in the rule base.

- Src1IsKey implies that bpo<Src1ImgSigT,BpoT> is used as key and that the argumenttype and resulttype are inserted in the rule base
- ArgsAreKey implies that bpo<Src1ImgSigT,Src2ImgSigT,BpoT> is used as key and that the resulttype is inserted in the rule base

```
60 { Src1IsKey, ArgsAreKey };
```

8.100.4 Constructor & Destructor Documentation

8.100.4.1 template<class DstImgSigT, class Src1ImgSigT, class Src2ImgSigT, class BpoT> HxImgFtorBpo< DstImgSigT, Src1ImgSigT, Src2ImgSigT, BpoT >::HxImgFtorBpo (RuleType *ruleType* = Src1IsKey) [inline]

Constructor.

```

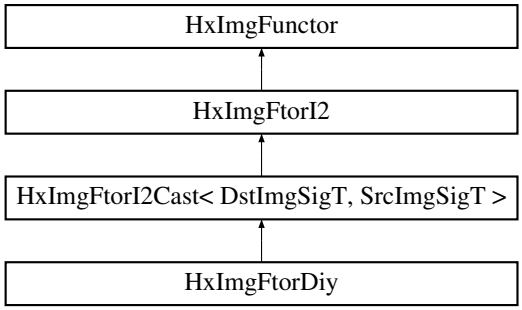
8.103 HxImgFtorDiy Class Template Reference

Instantiation of generic algorithm for do it yourself operations on images.

`#include <HxImgFtorDiy.h>`

Inheritance diagram for HxImgFtorDiy::



Public Types

- typedef **HxImgFtorDiyKey KeyType**

  The key type of this class.

Public Methods

- **HxImgFtorDiy** ()

  Constructor.

- virtual ~**HxImgFtorDiy** ()

  Destructor.

Protected Methods

- virtual void **doIt** (**Img1DataPtrType** dstPtr, **Img2DataPtrType** srcPtr, **HxSizes** dstSize, **HxSizes** srcSize, **HxTagList** &tags, **HxImgFtorDescription** *description=0)

  Do it.

8.103.1 Detailed Description

template<class DstImgSigT, class SrcImgSigT, class DiyT> class HxImgFtorDiy< DstImgSigT, SrcImgSigT, DiyT >

Instantiation of generic algorithm for do it yourself operations on images.

Template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- DiyT is the type of the do it yourself functor

8.103.2 Member Typedef Documentation

8.103.2.1 template<class DstImgSigT, class SrcImgSigT, class DiyT> typedef HxImgFtorDiyKey HxImgFtorDiy::KeyType

The key type of this class.

Reimplemented from **HxImgFtorI2Cast** (p. 745).

8.103.3 Constructor & Destructor Documentation

8.103.3.1 template<class DstImgSigT, class SrcImgSigT, class DiyT> HxImgFtorDiy< DstImgSigT, SrcImgSigT, DiyT >::HxImgFtorDiy () [inline]

Constructor.

```
18     : HxImgFtorI2Cast<DstImgSigT, SrcImgSigT>(
19         HxImgFtorDiyKey(
20             HxClassName<DstImgSigT>(), HxClassName<SrcImgSigT>(),
21             HxClassName<DiyT>()))
22 {
23     HxImgFtorRuleBase::instance().setResultType(
24         HxClassName<DstImgSigT>(), "diy",
25         HxClassName<SrcImgSigT>(), HxClassName<DiyT>());
26
27 }
```

8.103.3.2 template<class DstImgSigT, class SrcImgSigT, class DiyT> HxImgFtorDiy< DstImgSigT, SrcImgSigT, DiyT >::~HxImgFtorDiy () [virtual]

Destructor.

```
31 {
32 }
```

8.103.4 Member Function Documentation

8.103.4.1 template<class DstImgSigT, class SrcImgSigT, class DiyT> void HxImgFtorDiy< DstImgSigT, SrcImgSigT, DiyT >::doIt (Img1DataPtrType *dstPtr*, Img2DataPtrType *srcPtr*, HxSizes *dstSize*, HxSizes *srcSize*, HxTagList & *tags*, HxImgFtorDescription * *description* = 0) [protected, virtual]

Do it.

Parameters:

dstPtr Output image: IS = dstSize, IBS = 0

srcPtr Input image: IS = srcSize, IBS = 0

Calls the user defined functor to do the actual work.

Reimplemented from **HxImgFtorI2Cast** (p. 750).

```
41 {
42     DiyT diy(tags);
43
44     diy.doIt(dstPtr, srcPtr, dstSize, srcSize);
45 }
```

The documentation for this class was generated from the following files:

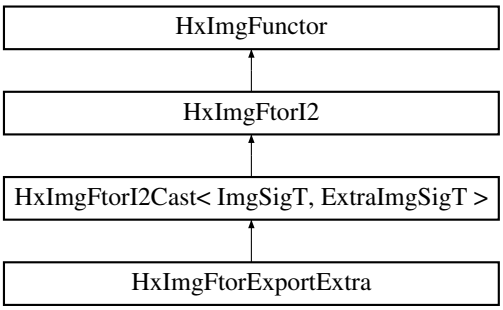
8.105 HxImgFtorExportExtra Class Template Reference

Instantiation of generic algorithm for export operation with an extra image.

`#include <HxImgFtorExportExtra.h>`

Inheritance diagram for HxImgFtorExportExtra::



Public Types

- typedef **HxImgFtorExportExtraKey KeyType**

  The key type of this class.

Public Methods

- **HxImgFtorExportExtra** ()

  Constructor.

- virtual ~**HxImgFtorExportExtra** ()

  Destructor.

Protected Methods

- virtual void **doIt** (**Img1DataPtrType** imPtr, **Img2DataPtrType** extraPtr, **HxSizes** dstSize, **HxSizes** srcSize, **HxTagList** &tags, **HxImgFtorDescription** *description=0)

  Calls **HxFuncExportExtraDispatch** (p. 156) *to dispatch the actual work.*

8.105.1 Detailed Description

template<class ImgSigT, class ExtraImgSigT, class ExportExtraT> class HxImgFtorExportExtra< ImgSigT, ExtraImgSigT, ExportExtraT >

Instantiation of generic algorithm for export operation with an extra image.

Template parameters:

- ImgSigT is the signature type of the image
- ExtraImgSigT is the signature type of the extra image
- ExportExtraT is the type of the export pixel functor

8.105.2 Member Typedef Documentation

8.105.2.1 template<class ImgSigT, class ExtraImgSigT, class ExportExtraT> typedef HxImgFtorExportExtraKey HxImgFtorExportExtra::KeyType

The key type of this class.

Reimplemented from **HxImgFtorI2Cast** (p. 745).

8.105.3 Constructor & Destructor Documentation

8.105.3.1 template<class ImgSigT, class ExtraImgSigT, class ExportExtraT> HxImgFtorExportExtra< ImgSigT, ExtraImgSigT, ExportExtraT >::HxImgFtorExportExtra () [inline]

Constructor.

```
23     : HxImgFtorI2Cast<ImgSigT,ExtraImgSigT>(
24             HxImgFtorExportExtraKey(HxClassName<ImgSigT>(),

52 }
```

8.115.4 Member Function Documentation

8.115.4.1 virtual void HxImgFtorI1::callIt (HxImageData * *img*, HxTagList & *tags*) [pure virtual]

callIt is implemented by **HxImgFtorI1Cast::callIt** (p. 734).

Reimplemented in **HxImgFtorI1Cast** (p. 734).

The documentation for this class was generated from the following file:

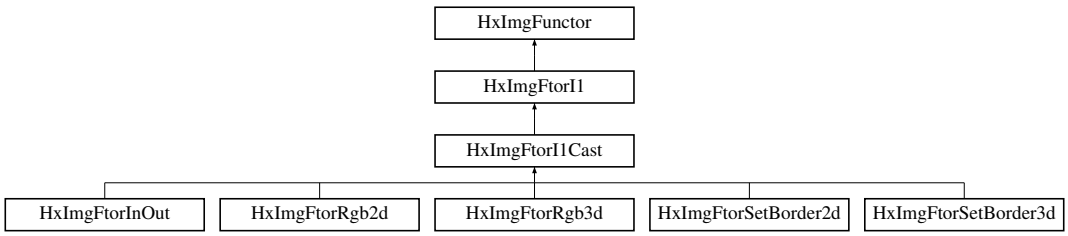
- **HxImgFtorI1.h**

8.116 HxImgFtorI1Cast Class Template Reference

Class for (checked) conversion of (polymorphic) **HxImageData** (p. 581) parameters of **HxImgFtorI1** (p. 728) to (statically typed) image data pointers.

`#include <HxImgFtorI1Cast.h>`

Inheritance diagram for HxImgFtorI1Cast::



Public Types

- typedef **HxImgFtorI1CastKey KeyType**

  The key type of this class.

- typedef ImgSigT::DataPtrType **ImgDataPtrType**

  The data pointer type of the image.

Public Methods

- **HxImgFtorI1Cast** (const **KeyType** &)

  Constructor.

- virtual ~**HxImgFtorI1Cast** ()

  Destructor.

- virtual void **callIt** (**HxImageData** *img, **HxTagList** &tags)

  Converts parameters and calls doIt.

Protected Methods

- virtual void **doIt** (**ImgDataPtrType** ptr, **HxSizes** size, **HxTagList** &tags, **HxImgFtorDescription** *=0)=0

  doIt is implemented by derived image functors:.

8.116.1 Detailed Description

template<class ImgSigT> class HxImgFtorI1Cast< ImgSigT >

Class for (checked) conversion of (polymorphic) **HxImageData** (p. 581) parameters of **HxImgFtorI1** (p. 728) to (statically typed) image data pointers.

Template parameters:

- ImgSigT is the signature type of the image

8.116.2 Member Typedef Documentation

8.116.2.1 template<class ImgSigT> typedef HxImgFtorI1CastKey HxImgFtorI1Cast::KeyType

The key type of this class.

Reimplemented from **HxImgFtorI1** (p. 729).

Reimplemented in **HxImgFtorInOut** (p. 793), **HxImgFtorRgb2d** (p. 836), **HxImgFtorRgb3d** (p. 838), **HxImgFtorSetBorder2d** (p. 850), **HxImgFtorSetBorder3d** (p. 853), **HxImgFtorInOut< ImgSigT, HxImageDataToHxMatrix< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxInOutSetVal< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxExportPpm< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxImportPackedRgb< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoSupAssign< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxImportBytes< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxImportPix< typename ImgSigT::ArithType, DataT > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoMulAssign< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxExportPix< typename ImgSigT::ArithType, DataT > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxInOutGetPoints< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoAddAssign< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoMaxAssign< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxGeneratePix< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT,**

8.116.2.2 template<class ImgSigT> typedef ImgSigT::DataPtrType HxImgFtorI1Cast::ImgDataPtrType

The data pointer type of the image.

8.116.3 Constructor & Destructor Documentation

8.116.3.1 template<class ImgSigT> HxImgFtorI1Cast< ImgSigT >::HxImgFtorI1Cast (const KeyType & *key*) [inline]

Constructor.

```
69                                                  : HxImgFtorI1(key)
70 {
71 }
```

8.116.3.2 template<class ImgSigT> HxImgFtorI1Cast< ImgSigT >::~HxImgFtorI1Cast () [virtual]

Destructor.

```
20 {
21 }
```

8.116.4 Member Function Documentation

8.116.4.1 template<class ImgSigT> void HxImgFtorI1Cast< ImgSigT >::callIt (HxImageData * *img*, HxTagList & *tags*) [virtual]

Converts parameters and calls doIt.

Reimplemented from **HxImgFtorI1** (p. 731).

```
26 {
27     TYPENAME ImgSigT::DataPtrType ptr
28         = HxMakeDataPtr<typename ImgSigT::DataPtrType>(img);
29
30     HxImgFtorDescription* description = getDescription();
31     if (description)
32     {
33         description->setTags(tags);
34         description->addArgument(img->signature(), img->sizes());
35         description->startTime();
36     }
37
38     doIt(ptr, img->sizes(), tags, description);
39     if (description)
40         description->stopTime();
41
42 }
```

8.116.4.2 template<class ImgSigT> virtual void HxImgFtorI1Cast< ImgSigT >::doIt (ImgDataPtrType *imgPtr*, HxSizes *imgSize*, HxTagList & *tags*, HxImgFtorDescription * *description* = 0) [protected, pure virtual]

doIt is implemented by derived image functors:.

- **HxImgFtorInOut::doIt** (p. 793)
- **HxImgFtorRgb2d::doIt** (p. 837)
- **HxImgFtorRgb3d::doIt** (p. 839)
- **HxImgFtorSetBorder2d::doIt** (p. 851)
- **HxImgFtorSetBorder3d::doIt** (p. 853)

Reimplemented in **HxImgFtorInOut** (p. 793), **HxImgFtorRgb2d** (p. 837), **HxImgFtorRgb3d** (p. 839), **HxImgFtorSetBorder2d** (p. 851), **HxImgFtorSetBorder3d** (p. 853), **HxImgFtorInOut< ImgSigT, HxImageDataToHxMatrix< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxInOutSetVal< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxExportPpm< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxImportPackedRgb< typename ImgSigT::ArithType > >** (p. 793), **HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoSupAssign< typename ImgSigT::ArithType, typename ImgSigT::ArithType >**

The documentation for this class was generated from the following file:

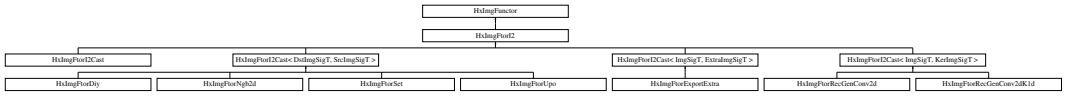
- **HxImgFtorI1Key.h**

8.119 HxImgFtorI2 Class Reference

Base class for image functors with two image parameters.

`#include <HxImgFtorI2.h>`

Inheritance diagram for HxImgFtorI2::



Public Types

- typedef **HxImgFtorI2Key KeyType**
  The key type of this class.

Public Methods

- **HxImgFtorI2** (const **KeyType** &)
  Constructor.
- virtual ~**HxImgFtorI2** ()
  Destructor.
- virtual void **callIt** (**HxImageData** *img1, **HxImageData** *img2, **HxTagList** &tags)=0
  callIt is implemented by **HxImgFtorI2Cast::callIt** (p. 749).

8.119.1 Detailed Description

Base class for image functors with two image parameters.

8.119.2 Member Typedef Documentation

8.119.2.1 typedef HxImgFtorI2Key HxImgFtorI2::KeyType

The key type of this class.

Reimplemented in **HxImgFtorDiy** (p. 706), **HxImgFtorExportExtra** (p. 709), **HxImgFtorI2Cast** (p. 745), **HxImgFtorNgb2d** (p. 812), **HxImgFtorRecGenConv2d** (p. 829), **HxImgFtorRecGenConv2dK1d** (p. 831), **HxImgFtorSet** (p. 848), **HxImgFtorUpo** (p. 860), **HxImgFtorDiy< ImgSigT, ImgSigT, HxDiyTranspose< typename ImgSigT::DataPtrType, typename ImgSigT::DataPtrType > >** (p. 706), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskMean< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraHistogram< typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskSum< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskMedian< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraWeightMaskSum< typename ExtraImSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskStdev< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskCentralMoments< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskMoments< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorI2Cast< DstSigT, SrcSigT >** (p. 745), **HxImgFtorI2Cast< HxImageSig2dFloat, SrcSigT >** (p. 745),

8.119.3 Constructor & Destructor Documentation

8.119.3.1 HxImgFtorI2::HxImgFtorI2 (const KeyType & *key*) [inline]

Constructor.

```
48                                          : HxImgFunctor(key)
49 {
50 }
```

8.119.3.2 HxImgFtorI2::~HxImgFtorI2 () [inline, virtual]

Destructor.

```
54 {
55 }
```

8.119.4 Member Function Documentation

8.119.4.1 virtual void HxImgFtorI2::callIt (HxImageData * *img1*, HxImageData * *img2*, HxTagList & *tags*) [pure virtual]

callIt is implemented by **HxImgFtorI2Cast::callIt** (p. 749).

Reimplemented in **HxImgFtorI2Cast** (p. 749), **HxImgFtorI2Cast< DstSigT, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dFloat, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dByte, SrcSigT >** (p. 749), **HxImgFtorI2Cast< ImgSigT, ImgSigT >** (p. 749), **HxImgFtorI2Cast< DstImgSigT, SrcImgSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig3dDouble, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig3dByte, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dVec3Float, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dVec2Float, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dDouble, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig3dInt, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dVec2Byte, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dVec3Byte, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dInt, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dVec3Double, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dVec3Short, SrcSigT >** (p. 749), **HxImgFtorI2Cast< DstSigT, ImgSigT >** (p. 749), **HxImgFtorI2Cast< ResSigT, ImgSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dVec2Double, SrcSigT >** (p. 749), **HxImgFtorI2Cast< ImgSigT, ExtraImSigT >** (p. 749), **HxImgFtorI2Cast< ImgSigT, KerSigT >** (p. 749), **HxImgFtorI2Cast< ImgSigT, ExtraImgSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig3dShort, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dShort, SrcSigT >** (p. 749), **HxImgFtorI2Cast< SrcSigT, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dVec2Int, SrcSigT >** (p. 749), **HxImgFtorI2Cast< ImgSigD, ImgSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dVec3Int, SrcSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dVec2Short, SrcSigT >** (p. 749), **HxImgFtorI2Cast< ImgSigT, KerImgSigT >** (p. 749), **HxImgFtorI2Cast< HxImageSig2dComplex, SrcSigT >** (p. 749), and **HxImgFtorI2Cast< HxImageSig3dFloat, SrcSigT >** (p. 749).

The documentation for this class was generated from the following file:

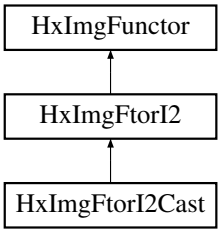
- **HxImgFtorI2.h**

8.120 HxImgFtorI2Cast Class Template Reference

Class for (checked) conversion of (polymorphic) **HxImageData** (p. 581) parameters of **HxImgFtorI2** (p. 737) to (statically typed) image data pointers.

`#include <HxImgFtorI2Cast.h>`

Inheritance diagram for HxImgFtorI2Cast::



Public Types

- typedef **HxImgFtorI2CastKey KeyType**
  The key type of this class.
- typedef Img1SigT::DataPtrType **Img1DataPtrType**
  The data pointer type of the first image.
- typedef Img2SigT::DataPtrType **Img2DataPtrType**
  The data pointer type of the second image.

Public Methods

- **HxImgFtorI2Cast** (const **KeyType** &)
  Constructor.
- virtual ~**HxImgFtorI2Cast** ()
  Destructor.
- virtual void **callIt** (**HxImageData** *img1, **HxImageData** *img2, **HxTagList** &tags)
  Converts parameters and calls doIt.

Protected Methods

- virtual void **doIt** (**Img1DataPtrType** img1Ptr, **Img2DataPtrType** img2Ptr, **HxSizes** img1Size, **HxSizes** img2Size, **HxTagList** &tags, **HxImgFtorDescription** *description=0)=0
  doIt is implemented by derived image functors:.

8.120.1 Detailed Description

template<class Img1SigT, class Img2SigT> class HxImgFtorI2Cast< Img1SigT, Img2SigT >

Class for (checked) conversion of (polymorphic) **HxImageData** (p. 581) parameters of **HxImgFtorI2** (p. 737) to (statically typed) image data pointers.

Template parameters:

- Img1SigT is the signature type of the fist image
- Img2SigT is the signature type of the second image

8.120.2 Member Typedef Documentation

8.120.2.1 template<class Img1SigT, class Img2SigT> typedef HxImgFtorI2CastKey HxImgFtorI2Cast::KeyType

The key type of this class.

Reimplemented from **HxImgFtorI2** (p. 738).

Reimplemented in **HxImgFtorDiy** (p. 706), **HxImgFtorExportExtra** (p. 709), **HxImgFtorNgb2d** (p. 812), **HxImgFtorRecGenConv2d** (p. 829), **HxImgFtorRecGenConv2dK1d** (p. 831), **HxImgFtorSet** (p. 848), **HxImgFtorUpo** (p. 860), **HxImgFtorDiy< ImgSigT, ImgSigT, HxDiyTranspose< typename ImgSigT::DataPtrType, typename ImgSigT::DataPtrType > >** (p. 706), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskMean< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraHistogram< typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskSum< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskMedian< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraWeightMaskSum< typename ExtraImSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskStdev< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskCentralMoments< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskMoments< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > >** (p. 709), **HxImgFtorNgb2d< ImgSigT, ImgSigT, HxNgbKuwahara< typename ImgSigT::ArithType, typename ImgSigT::ArithType > >** (p. 812), **HxImgFtorNgb2d< ImgSigT, ImgSigT, HxNgbNonMaxSuppression2d< typename ImgSigT::ArithType > >** (p. 812), **HxImgFtorNgb2d< ImgSigT, ImgSigT, HxNgbLWshed2d< typename ImgSigT::ArithType, typename ImgSigT::ArithType > >** (p. 812), **HxImgFtorNgb2d< ImgSigT, ImgSigT, HxNgbDefuz< typename ImgSigT::ArithType, typename ImgSigT::ArithType > >** (p. 812), **HxImgFtorNgb2d< ImgSigT, ImgSigT, HxNgbHilditch< typename ImgSigT::ArithType, typename ImgSigT::ArithType > >** (p. 812), **HxImgFtorNgb2d< ResSigT, ImgSigT, HxNgbMean< typename ResSigT::ArithType, typename ImgSigT::ArithType > >** (p. 812), **HxImgFtorNgb2d< ImgSigT, ImgSigT, HxNgbBernsen< typename ImgSigT::ArithType, typename ImgSigT::ArithType > >** (p. 812), **HxImgFtorNgb2d< ImgSigT, ImgSigT, HxNgbPercentile2d< typename ImgSigT::ArithType > >** (p. 812), **HxImgFtorNgb2d< DstSigT, SrcSigT, HxNgbIsMaxGradDir2d< typename DstSigT::ArithType, typename SrcSigT::ArithType > >** (p. 812), **HxImgFtorRecGenConv2d< ImgSigT, KerSigT, HxBpoMul< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, HxBpoAddAssign< typename KerSigT::ArithType, typename KerSigT::ArithType > >** (p. 829), **HxImgFtorRecGenConv2d< ImgSigT, KerSigT, HxBpoAdd< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, HxBpoMinAssign< typename KerSigT::ArithType, typename KerSigT::ArithType > >** (p. 829), **HxImgFtorRecGenConv2dK1d< ImgSigT, KerSigT, HxBpoMul< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, HxBpoAddAssign< typename KerSigT::ArithType, typename KerSigT::ArithType > >** (p. 831), **HxImgFtorRecGenConv2dK1d< ImgSigT, KerSigT, HxBpoAdd< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, HxBpoMinAssign< typename KerSigT::ArithType, typename KerSigT::ArithType > >** (p. 831), **HxImgFtorSet< HxImageSig2dFloat, SrcSigT >** (p. 848), **HxImgFtorSet< HxImageSig2dByte, SrcSigT >** (p. 848), **HxImgFtorSet< HxImageSig3dDouble, SrcSig-**

8.120.2.2 template<class Img1SigT, class Img2SigT> typedef Img1SigT::DataPtrType HxImgFtorI2Cast::Img1DataPtrType

The data pointer type of the first image.

8.120.2.3 template<class Img1SigT, class Img2SigT> typedef Img2SigT::DataPtrType HxImgFtorI2Cast::Img2DataPtrType

The data pointer type of the second image.

8.120.3 Constructor & Destructor Documentation

8.120.3.1 template<class Img1SigT, class Img2SigT> HxImgFtorI2Cast< Img1SigT, Img2SigT >::HxImgFtorI2Cast (const KeyType & *key*) [inline]

Constructor.

```
80             : HxImgFtorI2(key)
81 {
82 }
```

8.120.3.2 template<class Img1SigT, class Img2SigT> HxImgFtorI2Cast< Img1SigT, Img2SigT >::~HxImgFtorI2Cast () [virtual]

Destructor.

```
26 {
27 #ifdef CD_TRACE
28     HxEnvironment::instance()->outputStream()
29         << "HxImgFtorI2Cast<>::~HxImgFtorI2Cast()" << STD_ENDL;
30     HxEnvironment::instance()->flush();
31 #endif
32 }
```

8.120.4 Member Function Documentation

8.120.4.1 template<class Img1SigT, class Img2SigT> void HxImgFtorI2Cast< Img1SigT, Img2SigT >::callIt (HxImageData * *img1*, HxImageData * *img2*, HxTagList & *tags*) [virtual]

Converts parameters and calls doIt.

Reimplemented from **HxImgFtorI2** (p. 743).

```

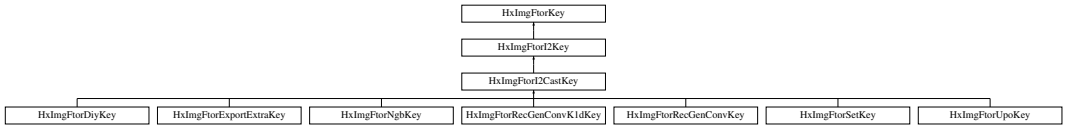
Inheritance diagram for HxImgFtorI2Key::



Public Methods

- **HxImgFtorI2Key** (**HxString** className, **HxString** sig1Name, **HxString** sig2Name)
  Constructor.

8.122.1 Detailed Description

Key for **HxImgFtorI2** (p. 737).

8.122.2 Constructor & Destructor Documentation

8.122.2.1 HxImgFtorI2Key::HxImgFtorI2Key (HxString *className*, HxString *sig1Name*, HxString *sig2Name*) [inline]

Constructor.

```
29     : HxImgFtorKey(className)
30 {
31     HxStringList l;
32     l << sig1Name << sig2Name;
33     setArguments(l.begin(), l.end());
34 }
```

The documentation for this class was generated from the following file:

- **HxImgFtorI2Key.h**

8.123 HxImgFtorI3 Class Reference

Base class for image functors with three image parameters.

`#include <HxImgFtorI3.h>`

Inheritance diagram for HxImgFtorI3::

Public Types

- typedef **HxImgFtorI3Key KeyType**

  The key type of this class.

Public Methods

- **HxImgFtorI3** (const **KeyType** &)

  Constructor.

- virtual ~**HxImgFtorI3** ()

  Destructor.

- virtual void **callIt** (**HxImageData** *img1, **HxImageData** *img2, **HxImageData** *img3, **HxTagList** &tags)=0

  callIt is implemented by **HxImgFtorI3Cast::callIt** (p. 764).

8.123.1 Detailed Description

Base class for image functors with three image parameters.

8.123.2 Member Typedef Documentation

8.123.2.1 typedef HxImgFtorI3Key HxImgFtorI3::KeyType

The key type of this class.

Reimplemented in **HxImgFtorBpo** (p. 701), **HxImgFtorGenConv2d** (p. 713), **HxImgFtorGenConv2dK1d** (p. 715), **HxImgFtorGenConv3d** (p. 722), **HxImgFtorGenConv3dK1d** (p. 725), **HxImgFtorI3Cast** (p. 761), **HxImgFtorKernelNgb2d** (p. 796), **HxImgFtorNgb2dExtra** (p. 814), **HxImgFtorBpo< DstSigT, ImgSigT, ImgSigT, HxBpoEqual< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > >** (p. 701), **HxImgFtorBpo< DstSigT, ImgSigT, ImgSigT, HxBpoLessThan< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > >** (p. 701), **HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoXor<**

8.123.3 Constructor & Destructor Documentation

8.123.3.1 HxImgFtorI3::HxImgFtorI3 (const KeyType & *key*) [inline]

Constructor.

```
48                                          : HxImgFunctor(key)
49 {
50 }
```

8.123.3.2 HxImgFtorI3::~HxImgFtorI3 () [inline, virtual]

Destructor.

```
54 {
55 }
```

8.123.4 Member Function Documentation

8.123.4.1 virtual void HxImgFtorI3::callIt (HxImageData * *img1*, HxImageData * *img2*, HxImageData * *img3*, HxTagList & *tags*) [pure virtual]

callIt is implemented by **HxImgFtorI3Cast::callIt** (p. 764).

Reimplemented in **HxImgFtorI3Cast** (p. 764), **HxImgFtorI3Cast< DstImgSigT, Src1ImgSigT, Src2ImgSigT >** (p. 764), **HxImgFtorI3Cast< ImgSigT, ImgSigT, LblSigT >** (p. 764), **HxImgFtorI3Cast< DstSigT, SrcSigT, KerSigT >** (p. 764), **HxImgFtorI3Cast< ImgSigT, ExtraSigT, AnotherSigT >** (p. 764), **HxImgFtorI3Cast< DstSigT, ImgSigT, ImgSigT >** (p. 764), **HxImgFtorI3Cast< ImgSigT, ImgSigT, ImgSigT >** (p. 764), **HxImgFtorI3Cast< DstImgSigT, SrcImgSigT, KerImgSigT >** (p. 764), **HxImgFtorI3Cast< ImgSigT, ExtraSigT, MaskImgSigT >** (p. 764), **HxImgFtorI3Cast< InOutT, InOutT, InOutT >** (p. 764), **HxImgFtorI3Cast< ImgSigT, KerSigT, KerSigT >** (p. 764), **HxImgFtorI3Cast< DstSigT, DstSigT, ImgSigT >** (p. 764), and **HxImgFtorI3Cast< DstImgSigT, SrcImgSigT, ExtraImgSigT >** (p. 764).

The documentation for this class was generated from the following file:

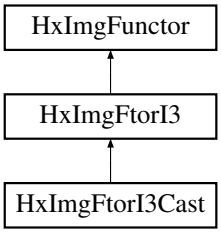
- **HxImgFtorI3.h**

8.124 HxImgFtorI3Cast Class Template Reference

Class for (checked) conversion of (polymorphic) **HxImageData** (p. 581) parameters of **HxImgFtorI3** (p. 756) to (statically typed) image data pointers.

`#include <HxImgFtorI3Cast.h>`

Inheritance diagram for HxImgFtorI3Cast::



Public Types

- typedef **HxImgFtorI3CastKey KeyType**

  The key type of this class.

- typedef Img1SigT::DataPtrType **Img1DataPtrType**

  The data pointer type of the first image.

- typedef Img2SigT::DataPtrType **Img2DataPtrType**

  The data pointer type of the second image.

- typedef Img3SigT::DataPtrType **Img3DataPtrType**

  The data pointer type of the third image.

Public Methods

- **HxImgFtorI3Cast** (const **KeyType** &)

  Constructor.

- virtual ∼**HxImgFtorI3Cast** ()

  Destructor.

- virtual void **callIt** (**HxImageData** ∗img1, **HxImageData** ∗img2, **HxImageData** ∗img3, **HxTagList** &tags)

  Converts parameters and calls doIt.

Protected Methods

- virtual void **doIt** (**Img1DataPtrType** img1Ptr, **Img2DataPtrType** img2Ptr, **Img3DataPtrType** img3Ptr, **HxSizes** img1Size, **HxSizes** img2Size, **HxSizes** img3Size, **HxTagList** &tags, **HxImgFtorDescription** ∗=0)=0

  doIt is implemented by derived image functors:.

8.124.1 Detailed Description

template<class Img1SigT, class Img2SigT, class Img3SigT> class HxImgFtorI3Cast< Img1SigT, Img2SigT, Img3SigT >

Class for (checked) conversion of (polymorphic) **HxImageData** (p. 581) parameters of **HxImgFtorI3** (p. 756) to (statically typed) image data pointers.

Template parameters:

- Img1SigT is the signature type of the first image
- Img2SigT is the signature type of the second image
- Img3SigT is the signature type of the third image

8.124.2 Member Typedef Documentation

8.124.2.1 template<class Img1SigT, class Img2SigT, class Img3SigT> typedef HxImgFtorI3CastKey HxImgFtorI3Cast::KeyType

The key type of this class.

Reimplemented from **HxImgFtorI3** (p. 756).

Reimplemented in **HxImgFtorBpo** (p. 701), **HxImgFtorGenConv2d** (p. 713), **HxImgFtorGenConv2dK1d** (p. 715), **HxImgFtorGenConv3d** (p. 722), **HxImgFtorGenConv3dK1d** (p. 725), **HxImgFtorKernelNgb2d** (p. 796), **HxImgFtorNgb2dExtra** (p. 814), **HxImgFtorBpo< DstSigT, ImgSigT, ImgSigT, HxBpoEqual< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< DstSigT, ImgSigT, ImgSigT, HxBpoLessThan< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoXor< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoMin< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoSqrDst< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< DstSigT, ImgSigT, ImgSigT, HxBpoGreaterEqual< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoSub< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoInf< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< DstSigT, ImgSigT, ImgSigT, HxBpoDot< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoOr< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxMagnitude< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoAnd< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoSup< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< DstSigT, ImgSigT, ImgSigT, HxBpoNotEqual< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoCross< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoPow< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > (p. 701), HxImgFtorBpo< ImgSigT, Img-**

8.124.2.2 template<class Img1SigT, class Img2SigT, class Img3SigT> typedef Img1SigT::DataPtrType HxImgFtorI3Cast::Img1DataPtrType

The data pointer type of the first image.

8.124.2.3 template<class Img1SigT, class Img2SigT, class Img3SigT> typedef Img2SigT::DataPtrType HxImgFtorI3Cast::Img2DataPtrType

The data pointer type of the second image.

8.124.2.4 template<class Img1SigT, class Img2SigT, class Img3SigT> typedef Img3SigT::DataPtrType HxImgFtorI3Cast::Img3DataPtrType

The data pointer type of the third image.

8.124.3 Constructor & Destructor Documentation

8.124.3.1 template<class Img1SigT, class Img2SigT, class Img3SigT> HxImgFtorI3Cast< Img1SigT, Img2SigT, Img3SigT >::HxImgFtorI3Cast (const KeyType & *key*) [inline]

Constructor.

```
85                                          : HxImgFtorI3(key)
86 {
87 }
```

8.124.3.2 template<class Img1SigT, class Img2SigT, class Img3SigT> HxImgFtorI3Cast< Img1SigT, Img2SigT, Img3SigT >::~HxImgFtorI3Cast () [virtual]

Destructor.

```
25 {
26 #ifdef CD_TRACE
27     HxEnvironment::instance()->outputStream()
28         << "~HxImgFtorI3Cast()" << STD_ENDL;
29     HxEnvironment::instance()->flush();
30 #endif
31 }
```

8.124.4 Member Function Documentation

8.124.4.1 template<class Img1SigT, class Img2SigT, class Img3SigT> void HxImgFtorI3Cast< Img1SigT, Img2SigT, Img3SigT >::callIt (HxImageData * *img1*, HxImageData * *img2*, HxImageData * *img3*, HxTagList & *tags*) [virtual]

Converts parameters and calls doIt.

Reimplemented from **HxImgFtorI3** (p. 759).

```
38 {
39     TYPENAME Img1SigT::DataPtrType img1Ptr
40         = HxMakeDataPtr<typename Img1SigT::DataPtrType>(img1);
41     TYPENAME Img2SigT::DataPtrType img2Ptr
42         = HxMakeDataPtr<typename Img2SigT::DataPtrType>(img2);
43     TYPENAME Img3SigT::DataPtrType img3Ptr
44         = HxMakeDataPtr<typename Img3SigT::DataPtrType>(img3);
45
46     HxImgFtorDescription* description = getDescription();

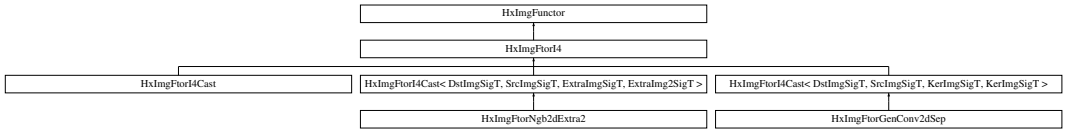
8.127 HxImgFtorI4 Class Reference

Base class for image functors with four image parameters.

`#include <HxImgFtorI4.h>`

Inheritance diagram for HxImgFtorI4::



Public Types

- typedef **HxImgFtorI4Key KeyType**

  The key type of this class.

Public Methods

- **HxImgFtorI4** (const **KeyType** &)

  Constructor.

- virtual ∼**HxImgFtorI4** ()

  Destructor.

- virtual void **callIt** (**HxImageData** ∗img1, **HxImageData** ∗img2, **HxImageData** ∗img3, **HxImageData** ∗img4, **HxTagList** &tags)=0

  callIt is implemented by **HxImgFtorI4Cast::callIt** (p. 775).

8.127.1 Detailed Description

Base class for image functors with four image parameters.

8.127.2 Member Typedef Documentation

8.127.2.1 typedef HxImgFtorI4Key HxImgFtorI4::KeyType

The key type of this class.

Reimplemented in **HxImgFtorGenConv2dSep** (p. 718), **HxImgFtorI4Cast** (p. 773), **HxImgFtorNgb2dExtra2** (p. 817), **HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoAdd< typename**

8.127.3 Constructor & Destructor Documentation

8.127.3.1 HxImgFtorI4::HxImgFtorI4 (const KeyType & *key*) [inline]

Constructor.

```
47                                              : HxImgFunctor(key)
48 {
49 }
```

8.127.3.2 HxImgFtorI4::~HxImgFtorI4 () [inline, virtual]

Destructor.

```
53 {
54 }
```

8.127.4 Member Function Documentation

8.127.4.1 virtual void HxImgFtorI4::callIt (HxImageData * *img1*, HxImageData * *img2*, HxImageData * *img3*, HxImageData * *img4*, HxTagList & *tags*) [pure virtual]

callIt is implemented by **HxImgFtorI4Cast::callIt** (p. 775).

Reimplemented in **HxImgFtorI4Cast** (p. 775), **HxImgFtorI4Cast< ImgSigT, KerSigT, KerSigT, KerSigT >** (p. 775), **HxImgFtorI4Cast< ResSigT, ImgSigT, ImgSigT, ImgSigT >** (p. 775), **HxImgFtorI4Cast< DstImgSigT, SrcImgSigT, ExtraImgSigT, ExtraImg2SigT >** (p. 775), and **HxImgFtorI4Cast< DstImgSigT, SrcImgSigT, KerImgSigT, KerImgSigT >** (p. 775).

The documentation for this class was generated from the following file:

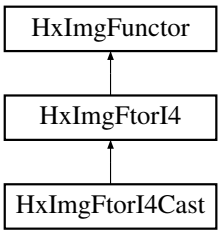
- **HxImgFtorI4.h**

8.128 HxImgFtorI4Cast Class Template Reference

Class for (checked) conversion of (polymorphic) **HxImageData** (p. 581) parameters of **HxImgFtorI4** (p. 770) to (statically typed) image data pointers.

`#include <HxImgFtorI4Cast.h>`

Inheritance diagram for HxImgFtorI4Cast::



Public Types

- typedef **HxImgFtorI4CastKey KeyType**
  The key type of this class.
- typedef Img1SigT::DataPtrType **Img1DataPtrType**
  The data pointer type of the first image.
- typedef Img2SigT::DataPtrType **Img2DataPtrType**
  The data pointer type of the second image.
- typedef Img3SigT::DataPtrType **Img3DataPtrType**
  The data pointer type of the third image.
- typedef Img4SigT::DataPtrType **Img4DataPtrType**
  The data pointer type of the fourth image.

Public Methods

- **HxImgFtorI4Cast** (const **KeyType** &)
  Constructor.
- virtual ~**HxImgFtorI4Cast** ()
  Destructor.
- virtual void **callIt** (**HxImageData** *img1, **HxImageData** *img2, **HxImageData** *img3, **HxImageData** *img4, **HxTagList** &tags)

Converts parameters and calls doIt.

Protected Methods

- virtual void **doIt** (**Img1DataPtrType** img1Ptr, **Img2DataPtrType** img2Ptr, **Img3DataPtrType** img3Ptr, **Img4DataPtrType** img4Ptr, **HxSizes** img1Size, **HxSizes** img2Size, **HxSizes** img3Size, **HxSizes** img4Size, **HxTagList** &tags, **HxImgFtorDescription** *=0)=0

  doIt is implemented by derived image functors:.

8.128.1 Detailed Description

template<class Img1SigT, class Img2SigT, class Img3SigT, class Img4SigT> class HxImgFtorI4Cast< Img1SigT, Img2SigT, Img3SigT, Img4SigT >

Class for (checked) conversion of (polymorphic) **HxImageData** (p. 581) parameters of **HxImgFtorI4** (p. 770) to (statically typed) image data pointers.

Template parameters:

- Img1SigT is the signature type of the first image
- Img2SigT is the signature type of the second image
- Img3SigT is the signature type of the third image
- Img4SigT is the signature type of the fourth image

8.128.2 Member Typedef Documentation

8.128.2.1 template<class Img1SigT, class Img2SigT, class Img3SigT, class Img4SigT> typedef HxImgFtorI4CastKey HxImgFtorI4Cast::KeyType

The key type of this class.

Reimplemented from **HxImgFtorI4** (p. 770).

Reimplemented in **HxImgFtorGenConv2dSep** (p. 718), **HxImgFtorNgb2dExtra2** (p. 817), **HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoAdd< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, HxBpoInfAssign< typename KerSigT::ArithType, typename KerSigT::ArithType >, HxKernel1d< typename KerSigT::DataPtrType, typename KerSigT::ArithType > >** (p. 718), **HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoAdd< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, HxBpoMaxAssign< typename KerSigT::ArithType, typename KerSigT::ArithType >, HxKernel1d< typename KerSigT::DataPtrType, typename KerSigT::ArithType > >** (p. 718), **HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoAdd< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, HxBpoSupAssign< typename KerSigT::ArithType, typename KerSigT::ArithType >, HxKernel1d< typename KerSigT::DataPtrType, typename KerSigT::ArithType > >** (p. 718), **HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoAdd< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, HxBpoMinAssign< typename KerSigT::ArithType, typename KerSigT::ArithType >, HxKernel1d< typename KerSigT::DataPtrType, typename KerSigT::ArithType > >** (p. 718), **HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoMul< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, HxBpoAddAssign< typename KerSigT::ArithType, typename KerSigT::ArithType >, HxKernel1d< typename**

KerSigT::DataPtrType, typename KerSigT::ArithType > > (p. 718), and **HxImgFtorNgb2dExtra2< ResSigT, ImgSigT, ImgSigT, ImgSigT, HxNgbOpticalFlow< typename ResSigT::ArithTypeDouble, typename ImgSigT::ArithType > >** (p. 817).

8.128.2.2 template<class Img1SigT, class Img2SigT, class Img3SigT, class Img4SigT> typedef Img1SigT::DataPtrType HxImgFtorI4Cast::Img1DataPtrType

The data pointer type of the first image.

8.128.2.3 template<class Img1SigT, class Img2SigT, class Img3SigT, class Img4SigT> typedef Img2SigT::DataPtrType HxImgFtorI4Cast::Img2DataPtrType

The data pointer type of the second image.

8.128.2.4 template<class Img1SigT, class Img2SigT, class Img3SigT, class Img4SigT> typedef Img3SigT::DataPtrType HxImgFtorI4Cast::Img3DataPtrType

The data pointer type of the third image.

8.128.2.5 template<class Img1SigT, class Img2SigT, class Img3SigT, class Img4SigT> typedef Img4SigT::DataPtrType HxImgFtorI4Cast::Img4DataPtrType

The data pointer type of the fourth image.

8.128.3 Constructor & Destructor Documentation

8.128.3.1 template<class Img1SigT, class Img2SigT, class Img3SigT, class Img4SigT> HxImgFtorI4Cast< Img1SigT, Img2SigT, Img3SigT, Img4SigT >::HxImgFtorI4Cast (const KeyType & *key*) [inline]

Constructor.

```
84                                          : HxImgFtorI4(key)
85 {
86 }
```

8.128.3.2 template<class Img1SigT, class Img2SigT, class Img3SigT, class Img4SigT> HxImgFtorI4Cast< Img1SigT, Img2SigT, Img3SigT, Img4SigT >::~HxImgFtorI4Cast () [virtual]

Destructor.

```
23 {
24 #ifdef CD_TRACE
25     HxEnvironment::instance()->outputStream()
26         << "~HxImgFtorI4Cast()" << STD_ENDL;
27     HxEnvironment::instance()->flush();
28 #endif
29 }
```

8.128.4 Member Function Documentation

8.128.4.1 template<class Img1SigT, class Img2SigT, class Img3SigT, class Img4SigT> void HxImgFtorI4Cast< Img1SigT, Img2SigT, Img3SigT, Img4SigT >::callIt (HxImageData * *img1*, HxImageData * *img2*, HxImageData * *img3*, HxImageData * *img4*, HxTagList & *tags*) [virtual]

Converts parameters and calls doIt.

Reimplemented from **HxImgFtorI4** (p. 771).

```
36 {
37     TYPENAME Img1SigT::DataPtrType img1Ptr
38         = HxMakeDataPtr<typename Img1SigT::DataPtrType>(img1);

  Do it.

8.149.1 Detailed Description

template<class DstImgSigT, class SrcImgSigT, class NgbT> class HxImgFtorNgb2d< DstImgSigT, SrcImgSigT, NgbT >

Instantiation of generic algorithm for neighborhood operations on 2D images.

Template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- NgbT is the type of the neighbourhood functor

8.149.2 Member Typedef Documentation

8.149.2.1 template<class DstImgSigT, class SrcImgSigT, class NgbT> typedef HxImgFtorNgbKey HxImgFtorNgb2d::KeyType

The key type of this class.

Reimplemented from **HxImgFtorI2Cast** (p. 745).

8.149.3 Constructor & Destructor Documentation

8.149.3.1 template<class DstImgSigT, class SrcImgSigT, class NgbT> HxImgFtorNgb2d< DstImgSigT, SrcImgSigT, NgbT >::HxImgFtorNgb2d () [inline]

Constructor.

```
21     : HxImgFtorI2Cast<DstImgSigT, SrcImgSigT>(
22         HxImgFtorNgbKey(
23             HxClassName<DstImgSigT>(), HxClassName<SrcImgSigT>(),
24             HxClassName<NgbT>()))
25 {
26     HxImgFtorRuleBase::instance().setResultType(

Destructor.

```
34 {
35 }
```

8.149.4 Member Function Documentation

8.149.4.1 template<class DstImgSigT, class SrcImgSigT, class NgbT> bool HxImgFtorNgb2d< DstImgSigT, SrcImgSigT, NgbT >::probeOp (HxTagList & *tags*) const [virtual]

Probe for border size.

Reimplemented from **HxImgFunctor** (p. 864).

```
41 {
42     NgbT ngb(tags);
43     HxSizes borderSize = ngb.size() / HxSizes(2,2,2);
44     HxAddTag<HxSizes>(tags, "borderSize", borderSize);
45     return true;
46 }
```

8.149.4.2 template<class DstImgSigT, class SrcImgSigT, class NgbT> void HxImgFtorNgb2d< DstImgSigT, SrcImgSigT, NgbT >::doIt (Img1DataPtrType *dstPtr*, Img2DataPtrType *srcPtr*, HxSizes *dstSize*, HxSizes *srcSize*, HxTagList & *tags*, HxImgFtorDescription * *description* = 0) [protected, virtual]

Do it.

Parameters:

dstPtr Output image: IS = dstSize, IBS = 0

srcPtr Input image: IS = srcSize, IBS = taglist(borderSize)

Calls **HxFuncNgbOp2dDispatch** (p. 202) to dispatch the actual work.

Reimplemented from **HxImgFtorI2Cast** (p. 750).

```
55 {
56     NgbT ngb(tags);
57
58     if (description) {
59         HxString v(typename NgbT::IteratorCategory().toString());
60         v += ", ";
61         v += typename NgbT::PhaseCategory().toString();
62         description->setVariation(v);
63     }
64
65     HxFuncNgbOp2dDispatch(dstPtr, srcPtr, dstSize, ngb);
66 }
```

8.158.1 Detailed Description

template<class ImgSigT, class KerImgSigT, class PixOpT, class RedOpT> class HxImgFtorRecGenConv2d< ImgSigT, KerImgSigT, PixOpT, RedOpT >

Instantiation of generic algorithm for recursive generalized convolution on 2D images.

Template parameters:

- ImgSigT is the signature type of the source/destination image
- KerImgSigT is the signature type of the kernel image
- PixOpT is the type of the pixel combining functor
- RedOpT is the type of the pixel reducing functor

8.158.2 Member Typedef Documentation

8.158.2.1 template<class ImgSigT, class KerImgSigT, class PixOpT, class RedOpT> typedef HxImgFtorRecGenConvKey HxImgFtorRecGenConv2d::KeyType

The key type of this class.

Reimplemented from **HxImgFtorI2Cast** (p. 745).

8.158.3 Constructor & Destructor Documentation

8.158.3.1 template<class ImgSigT, class KerImgSigT, class PixOpT, class RedOpT> HxImgFtorRecGenConv2d< ImgSigT, KerImgSigT, PixOpT, RedOpT >::HxImgFtorRecGenConv2d ()

Constructor.

```
30         : HxImgFtorI2Cast<ImgSigT, KerImgSigT>(
31             HxImgFtorRecGenConvKey(
32                 HxClassName<ImgSigT>(), HxClassName<KerImgSigT>(),
33                 HxClassName<PixOpT>(), HxClassName<RedOpT>()))
34 {
35 #ifdef CD_TRACE
36     HxEnvironment::instance()->outputStream()
37         << "HxImgFtorRecGenConv2d::HxImgFtorRecGenConv2d()" << STD_ENDL;
38 #endif
39 }
```

8.158.3.2 template<class ImgSigT, class KerImgSigT, class PixOpT, class RedOpT> HxImgFtorRecGenConv2d< ImgSigT, KerImgSigT, PixOpT, RedOpT >::~HxImgFtorRecGenConv2d () [virtual]

Destructor.

```
44 {
45 #ifdef CD_TRACE
46     HxEnvironment::instance()->outputStream()
47         << "HxImgFtorRecGenConv2d::~HxImgFtorRecGenConv2d()" << STD_ENDL;
48 #endif
49 }
```

8.158.4 Member Function Documentation

8.158.4.1 template<class ImgSigT, class KerImgSigT, class PixOpT, class RedOpT> void HxImgFtorRecGenConv2d< ImgSigT, KerImgSigT, PixOpT, RedOpT >::doIt (Img1DataPtrType *imgPtr*, Img2DataPtrType *kerPtr*, HxSizes *imgSize*, HxSizes *kerSize*, HxTagList & *tags*, HxImgFtorDescription * *description* = 0) [protected, virtual]

Do it.

Parameters:

imgPtr Input/Output image: IS = imgSize, IBS = kerSize/2

kerPtr Input image, IS = kerSize, IBS = 0

Calls HxFuncRecGenConvOp2dDispatch to dispatch the actual work.

Reimplemented from **HxImgFtorI2Cast** (p. 750).

```
58 {
59     PixOpT pixOp(tags);
60     RedOpT redOp(tags);
61
62     typedef typename KerImgSigT::ArithType ArithType;
63     ArithType dummy;
64
65     HxFuncRecGenConv2dDispatch(imgPtr, kerPtr, dummy, imgSize,
66                                kerSize, pixOp, redOp);
67 }
```

Table with (**HxImgFtorKey** (p. 799), **HxImgFunctor** (p. 862)∗) pairs.

`#include <HxImgFtorTable.h>`

Public Methods

- void **insert** (const **HxImgFtorKey** &key, **HxImgFunctor** ∗f)
  Insert a (key,functor) combination.
- **HxImgFunctor** ∗ **find** (const **HxImgFtorKey** &key)
  Find functor based on given key.
- void **addImgFtorObserver** (**HxImgFtorObserver** ∗)
  Add an image functor observer.
- STD_OSTREAM & **put** (STD_OSTREAM &) const
  Put on the given stream.
- ∼**HxImgFtorTable** ()
  Destructor.

Static Public Methods

- HxImgFtorTable & **instance** ()
  Access to this singleton class.

Protected Methods

- **HxImgFtorTable** ()
- **HxImgFtorTable** (const HxImgFtorTable &)

8.171.1 Detailed Description

Table with (**HxImgFtorKey** (p. 799), **HxImgFunctor** (p. 862)∗) pairs.

8.171.2 Constructor & Destructor Documentation

8.171.2.1 HxImgFtorTable::~HxImgFtorTable ()

Destructor.

```
33 {
34 #ifdef CD_TRACE
35     HxEnvironment::instance()->outputStream()
36         << "HxImgFtorTable::~HxImgFtorTable()" << STD_ENDL;
37 #endif
38 }
```

8.171.3 Member Function Documentation

8.171.3.1 HxImgFtorTable & HxImgFtorTable::instance () [static]

Access to this singleton class.

```
46 {
47     static HxImgFtorTable _instance;
48     return _instance;
49 }
```

8.171.3.2 void HxImgFtorTable::insert (const HxImgFtorKey & *key*, HxImgFunctor * *f*)

Insert a (key,functor) combination.

```
53 {
54     _map[key] = f;
55 
56     static int entryNum = 0;
57     static HxRegKey* entryKey
58         = HxRegistry::instance().insertKey("/imagefunctortable/entries");
59     HxRegKey* classKey
60         = entryKey->insertKey(key.getClassName());
61     HxString entryName("entry");
62     entryName += makeString(entryNum++);
63     classKey->insertValue(entryName, HxRegData(key.toString()));
64 
65     ObserverList::iterator p;
66     for (p = _observerList.begin(); p != _observerList.end(); p++)
67         (*p)->inserted(key, *f);
68 }
```

8.171.3.3 HxImgFunctor * HxImgFtorTable::find (const HxImgFtorKey & *key*)

Find functor based on given key.

```
72 {
73     Map::iterator i;
74 #ifdef IF_DEBUG
75     HxEnvironment::instance()->outputStream()
76         << "Was requested to find " << key << STD_ENDL;
```

```
77     HxEnvironment::instance()->flush();
78 #endif IF_DEBUG
79     i = _map.find(key);
80     if (i == _map.end())
81         return 0;
82 #ifdef IF_DEBUG
83     HxEnvironment::instance()->outputStream()
84         << "And indeed found" << STD_ENDL << " ==> ";
85     HxEnvironment::instance()->flush();
86     ((*i).second)->put(HxEnvironment::instance()->outputStream());
87     HxEnvironment::instance()->outputStream() << STD_ENDL;
88     HxEnvironment::instance()->flush();
89 #endif IF_DEBUG
90     return (*i).second;
91 }
```

8.171.3.4 void HxImgFtorTable::addImgFtorObserver (HxImgFtorObserver * *observer*)

Add an image functor observer.

```
95 {
96     _observerList.push_back(observer);
97 }
```

8.171.3.5 STD_OSTREAM & HxImgFtorTable::put (STD_OSTREAM & *os*) const

Put on the given stream.

```
101 {
102     Map::const_iterator i;
103     os << "HxImgFtorTable" << STD_ENDL;
104     for(i = _map.begin();i != _map.end();i++)
105     {
106         os << (*i).first << STD_ENDL;
107     }
108     return os;
109 }
```

The documentation for this class was generated from the following files:

- **HxImgFtorTable.h**
- HxImgFtorTable.c

8.172 HxImgFtorTableTem Class Template Reference

Template for typed access to the **HxImgFtorTable** (p. 856).

`#include <HxImgFtorTableTem.h>`

Public Methods

- FunctorType * **find** (const typename FunctorType::KeyType &key) const
  Find functor in the **HxImgFtorTable** (p. 856) *based on given key and cast the result to FunctorType.*

8.172.1 Detailed Description

template<class FunctorType> class HxImgFtorTableTem< FunctorType >

Template for typed access to the **HxImgFtorTable** (p. 856).

8.172.2 Member Function Documentation

8.172.2.1 template<class FunctorType> FunctorType* HxImgFtorTableTem< FunctorType >::find (const typename FunctorType::KeyType & *key*) const [inline]

Find functor in the **HxImgFtorTable** (p. 856) based on given key and cast the result to FunctorType.

```
28     {
29         return (FunctorType*)(HxImgFtorTable::instance().find(key));
30     }
```

The documentation for this class was generated from the following file:

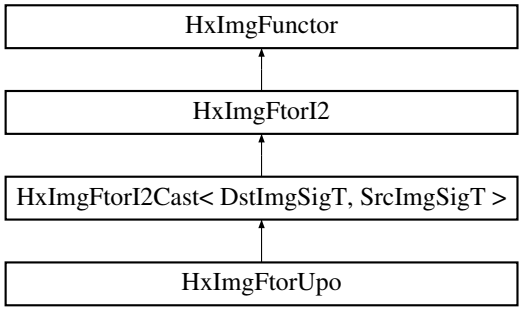
- **HxImgFtorTableTem.h**

8.173 HxImgFtorUpo Class Template Reference

Instantiation of generic algorithm for unary pixel operations on images.

`#include <HxImgFtorUpo.h>`

Inheritance diagram for HxImgFtorUpo::



Public Types

- typedef **HxImgFtorUpoKey KeyType**
  The key type of this class.

Public Methods

- **HxImgFtorUpo** ()
  Constructor.

- virtual ~**HxImgFtorUpo** ()

  Destructor.

Protected Methods

- virtual void **doIt** (**Img1DataPtrType** dstPtr, **Img2DataPtrType** srcPtr, **HxSizes** dstSize, **HxSizes** srcSize, **HxTagList** &tags, **HxImgFtorDescription** *description=0)

  Calls **HxFuncUpoDispatch** (p. 225) *to dispatch the actual work.*

8.173.1 Detailed Description

template<class DstImgSigT, class SrcImgSigT, class UpoT> class HxImgFtorUpo< DstImgSigT, SrcImgSigT, UpoT >

Instantiation of generic algorithm for unary pixel operations on images.

Template parameters:

- DstImgSigT is the signature type of the destination image
- SrcImgSigT is the signature type of the source image
- UpoT is the type of the pixel functor

8.173.2 Member Typedef Documentation

8.173.2.1 template<class DstImgSigT, class SrcImgSigT, class UpoT> typedef HxImgFtorUpoKey HxImgFtorUpo::KeyType

The key type of this class.

Reimplemented from **HxImgFtorI2Cast** (p. 745).

8.173.3 Constructor & Destructor Documentation

8.173.3.1 template<class DstImgSigT, class SrcImgSigT, class UpoT> HxImgFtorUpo< DstImgSigT, SrcImgSigT, UpoT >::HxImgFtorUpo () [inline]

Constructor.

```
23     : HxImgFtorI2Cast<DstImgSigT, SrcImgSigT>(
24         HxImgFtorUpoKey(HxClassName<DstImgSigT>(), HxClassName<SrcImgSigT>(),
25             HxClassName<UpoT>()))
26 {
27 #ifdef CD_TRACE
28     HxEnvironment::instance()->outputStream()
29         << "HxImgFtorUpo::HxImgFtorUpo()" << STD_ENDL;
30 #endif
31     HxImgFtorRuleBase::instance().setResultType(
32         HxClassName<DstImgSigT>(), "upo",
33         HxClassName<SrcImgSigT>(), HxClassName<UpoT>());
34 }
```

8.173.3.2 template<class DstImgSigT, class SrcImgSigT, class UpoT> HxImgFtorUpo< DstImgSigT, SrcImgSigT, UpoT >::~HxImgFtorUpo () [virtual]

Destructor.

```
38 {
39 #ifdef CD_TRACE
40     HxEnvironment::instance()->outputStream()
41         << "HxImgFtorUpo::~HxImgFtorUpo()" << STD_ENDL;
42 #endif
43 }
```

8.173.4 Member Function Documentation

8.173.4.1 template<class DstImgSigT, class SrcImgSigT, class UpoT> void HxImgFtorUpo< DstImgSigT, SrcImgSigT, UpoT >::doIt (Img1DataPtrType *dstPtr*, Img2DataPtrType *srcPtr*, HxSizes *dstSize*, HxSizes *srcSize*, HxTagList & *tags*, HxImgFtorDescription * *description* = 0) [protected, virtual]

Calls **HxFuncUpoDispatch** (p. 225) to dispatch the actual work.

Reimplemented from **HxImgFtorI2Cast** (p. 750).

```
51 {
52     UpoT upo(tags);
53
54     if (description) {
55         HxString v(typename UpoT::TransVarianceCategory().toString());
56         description->setVariation(v);
57     }
58
59     HxFuncUpoDispatch(dstPtr, srcPtr, dstSize, upo);
60 }
```

The documentation for this class was generated from the following files:

- **HxImgFtorUpo.h**

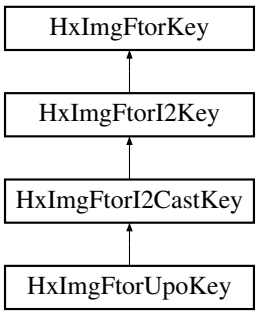
8.174 HxImgFtorUpoKey Class Reference

Key for **HxImgFtorUpo** (p. 859).

`#include <HxImgFtorUpoKey.h>`

Inheritance diagram for HxImgFtorUpoKey::



Public Methods

- **HxImgFtorUpoKey** (**HxString** dstImgSig, **HxString** srcImgSig, **HxString** upoName)
  Constructor.

8.174.1 Detailed Description

Key for **HxImgFtorUpo** (p. 859).

8.174.2 Constructor & Destructor Documentation

8.174.2.1 HxImgFtorUpoKey::HxImgFtorUpoKey (HxString *dstImgSig*, HxString *srcImgSig*, HxString *upoName*) [inline]

Constructor.

```
30     : HxImgFtorI2CastKey("HxImgFtorUpo", dstImgSig, srcImgSig)
31 {
32     addArgument(upoName);
33 }
```

The documentation for this class was generated from the following file:

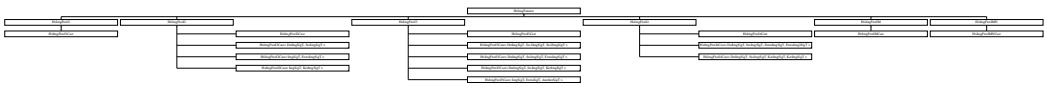
- **HxImgFtorUpoKey.h**

8.175 HxImgFunctor Class Reference

The base class of all image functors.

`#include <HxImgFunctor.h>`

Inheritance diagram for HxImgFunctor::



Public Methods

- **HxImgFunctor** (const **HxImgFtorKey** &)
  Constructor.
- virtual ~**HxImgFunctor** ()
  Destructor.
- virtual STD_OSTREAM & **put** (STD_OSTREAM &) const
  Put on stream.
- virtual bool **probeOp** (**HxTagList** &) const
  Some operator instantiations can be queried for pre-condition information.

Protected Methods

- **HxImgFtorDescription** * **getDescription** () const

8.175.1 Detailed Description

The base class of all image functors.

8.175.2 Constructor & Destructor Documentation

8.175.2.1 HxImgFunctor::HxImgFunctor (const HxImgFtorKey & *key*)

Constructor.

```
18 {
19     HxImgFtorTable::instance().insert(key,this);
20     _key = key;
21 }
```

8.175.2.2 HxImgFunctor::~HxImgFunctor () [virtual]

Destructor.

```
24 {
25     // To do: remove from table
26 }
```

8.175.3 Member Function Documentation

8.175.3.1 STD_OSTREAM & HxImgFunctor::put (STD_OSTREAM & *os*) const [virtual]

Put on stream.

```
36 {
37     return os << _key;
38 }
```

8.175.3.2 bool HxImgFunctor::probeOp (HxTagList & *tags*) const [virtual]

Some operator instantiations can be queried for pre-condition information.

Reimplemented in **HxImgFtorKernelNgb2d** (p. 797), **HxImgFtorMNpo** (p. 805), **HxImgFtorNgb2d** (p. 812), **HxImgFtorNgb2dExtra** (p. 815), and **HxImgFtorNgb2dExtra2** (p. 818).

```
30 {
31     return true;
32 }
```

The documentation for this class was generated from the following files:

- **HxImgFunctor.h**
- HxImgFunctor.c

8.176 HxInstantiatorAbs Class Template Reference

Instantiator for unary pixel operation with absolute value.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoAbs**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.176.1 Detailed Description

template<class ImgSigT> class HxInstantiatorAbs< ImgSigT >

Instantiator for unary pixel operation with absolute value.

8.176.2 Member Data Documentation

8.176.2.1 template<class ImgSigT> HxImgFtorUpo< ImgSigT, ImgSigT, HxUpoAbs<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorAbs::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoAbsInst.c

8.177 HxInstantiatorAcos Class Template Reference

Instantiator for unary pixel operation with arc cosine.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoAcos**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.177.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorAcos**< **ImgSigT** >

Instantiator for unary pixel operation with arc cosine.

8.177.2 Member Data Documentation

8.177.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoAcos<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorAcos::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoAcosInst.c

8.178 HxInstantiatorAdd Class Template Reference

Instantiator for binary pixel operation with addition.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoAdd**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.178.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorAdd**< **ImgSigT** >

Instantiator for binary pixel operation with addition.

8.178.2 Member Data Documentation

8.178.2.1 template<class ImgSigT> HxImgFtorBpo< ImgSigT, ImgSigT, ImgSigT, HxBpoAdd<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorAdd::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoAddInst.c

8.179 HxInstantiatorAddReduce Class Template Reference

Instantiator for reduce operation with addition.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxReduceAdaptor< **HxBpoAddAssign**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.179.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorAddReduce**< **ImgSigT** >

Instantiator for reduce operation with addition.

8.179.2 Member Data Documentation

8.179.2.1 template<class ImgSigT> HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoAddAssign<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorAddReduce::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxReduceAddAssignInst.c

8.180 HxInstantiatorAddSat Struct Template Reference

Instantiator for binary pixel operation with squared distance.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoAddSat**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.180.1 Detailed Description

template<class ImgSigT> struct HxInstantiatorAddSat< ImgSigT >

Instantiator for binary pixel operation with squared distance.

8.180.2 Member Data Documentation

8.180.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoAddSat<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorAddSat::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxAddSat.c

8.181 HxInstantiatorAddV Class Template Reference

Instantiator for binary pixel operation with addition with a value.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoAdd**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.181.1 Detailed Description

template<class ImgSigT> class HxInstantiatorAddV< ImgSigT >

Instantiator for binary pixel operation with addition with a value.

8.181.2 Member Data Documentation

8.181.2.1 template<class ImgSigT> HxImgFtorUpo< ImgSigT, ImgSigT, HxBpoBind2Val< typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoAdd< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > HxInstantiatorAddV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoAddInst.c

8.182 HxInstantiatorAnd Class Template Reference

Instantiator for binary pixel operation with and.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoAnd**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.182.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorAnd**< **ImgSigT** >

Instantiator for binary pixel operation with and.

8.182.2 Member Data Documentation

8.182.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoAnd<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorAnd::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoAndInst.c

8.183 HxInstantiatorAndV Class Template Reference

Instantiator for binary pixel operation with and.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoAnd**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.183.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorAndV**< **ImgSigT** >

Instantiator for binary pixel operation with and.

8.183.2 Member Data Documentation

8.183.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoAnd<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorAndV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoAndInst.c

8.184 HxInstantiatorArg Class Template Reference

Instantiator for unary pixel operation with argument.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoArg**< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.184.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorArg< DstSigT, ImgSigT >

Instantiator for unary pixel operation with argument.

8.184.2 Member Data Documentation

8.184.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoArg<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorArg::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoArgInst.c

8.185 HxInstantiatorAsin Class Template Reference

Instantiator for unary pixel operation with arc sine.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoAsin**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.185.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorAsin**< **ImgSigT** >

Instantiator for unary pixel operation with arc sine.

8.185.2 Member Data Documentation

8.185.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoAsin<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorAsin::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoAsinInst.c

8.186 HxInstantiatorAtan Class Template Reference

Instantiator for unary pixel operation with arc tangent.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoAtan**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.186.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorAtan**< **ImgSigT** >

Instantiator for unary pixel operation with arc tangent.

8.186.2 Member Data Documentation

8.186.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoAtan<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorAtan::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoAtanInst.c

8.187 HxInstantiatorAtan2 Class Template Reference

Instantiator for unary pixel operation with arc tangent.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoAtan2**< typename DstSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.187.1 Detailed Description

template<**class DstSigT, class ImgSigT**> **class HxInstantiatorAtan2**< **DstSigT, ImgSigT** >

Instantiator for unary pixel operation with arc tangent.

8.187.2 Member Data Documentation

8.187.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoAtan2<typename DstSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorAtan2::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoAtan2Inst.c

8.188 HxInstantiatorCeil Class Template Reference

Instantiator for unary pixel operation with ceiling.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoCeil**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.188.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorCeil**< **ImgSigT** >

Instantiator for unary pixel operation with ceiling.

8.188.2 Member Data Documentation

8.188.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoCeil<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorCeil::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoCeilInst.c

8.189 HxInstantiatorColSpace Class Template Reference

Instantiator for unary pixel operation with color space conversion.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoColSpace**< typename DstSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.189.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorColSpace< DstSigT, ImgSigT >

Instantiator for unary pixel operation with color space conversion.

8.189.2 Member Data Documentation

8.189.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoColSpace<typename DstSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorColSpace::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoColSpaceInst.c

8.190 HxInstantiatorComplement Class Template Reference

Instantiator for unary pixel operation with complement.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoComplement**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

Instantiate image functor.

8.190.1 Detailed Description

template<class ImgSigT> class HxInstantiatorComplement< ImgSigT >

Instantiator for unary pixel operation with complement.

8.190.2 Member Data Documentation

8.190.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoComplement<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorComplement::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoComplementInst.c

8.191 HxInstantiatorConjugate Class Template Reference

Instantiator for unary pixel operation with conjugate.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoConjugate**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.191.1 Detailed Description

template<class ImgSigT> class HxInstantiatorConjugate< ImgSigT >

Instantiator for unary pixel operation with conjugate.

8.191.2 Member Data Documentation

8.191.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoConjugate<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorConjugate::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoConjugateInst.c

8.192 HxInstantiatorCos Class Template Reference

Instantiator for unary pixel operation with cosine.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoCos**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.192.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorCos**< **ImgSigT** >

Instantiator for unary pixel operation with cosine.

8.192.2 Member Data Documentation

8.192.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoCos<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorCos::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoCosInst.c

8.193 HxInstantiatorCosh Class Template Reference

Instantiator for unary pixel operation with hyperbolic cosine.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoCosh**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.193.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorCosh**< **ImgSigT** >

Instantiator for unary pixel operation with hyperbolic cosine.

8.193.2 Member Data Documentation

8.193.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoCosh<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorCosh::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoCoshInst.c

8.194 HxInstantiatorCross Class Template Reference

Instantiator for binary pixel operation with cross product.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoCross**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.194.1 Detailed Description

template<class ImgSigT> class HxInstantiatorCross< ImgSigT >

Instantiator for binary pixel operation with cross product.

8.194.2 Member Data Documentation

8.194.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoCross<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorCross::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoCrossInst.c

8.195 HxInstantiatorCrossV Class Template Reference

Instantiator for binary pixel operation with cross product.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoCross**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

Instantiate image functor.

8.195.1 Detailed Description

template<class ImgSigT> class HxInstantiatorCrossV< ImgSigT >

Instantiator for binary pixel operation with cross product.

8.195.2 Member Data Documentation

8.195.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoCross<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorCrossV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoCrossInst.c

8.196 HxInstantiatorDiv Class Template Reference

Instantiator for binary pixel operation with division.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoDiv**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.196.1 Detailed Description

template<class ImgSigT> class HxInstantiatorDiv< ImgSigT >

Instantiator for binary pixel operation with division.

8.196.2 Member Data Documentation

8.196.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoDiv<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorDiv::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoDivInst.c

8.197 HxInstantiatorDivV Class Template Reference

Instantiator for binary pixel operation with division.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoDiv**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.197.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorDivV**< **ImgSigT** >

Instantiator for binary pixel operation with division.

8.197.2 Member Data Documentation

8.197.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoDiv<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorDivV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoDivInst.c

8.198 HxInstantiatorDot Class Template Reference

Instantiator for binary pixel operation with dot product.

Public Attributes

- **HxImgFtorBpo**< DstSigT, ImgSigT, ImgSigT, **HxBpoDot**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.198.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorDot< DstSigT, ImgSigT >

Instantiator for binary pixel operation with dot product.

8.198.2 Member Data Documentation

8.198.2.1 template<class DstSigT, class ImgSigT> HxImgFtorBpo<DstSigT, ImgSigT, ImgSigT, HxBpoDot<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorDot::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoDotInst.c

8.199 HxInstantiatorDotV Class Template Reference

Instantiator for binary pixel operation with dot product.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxBpoBind2Val**< typename DstSigT::ArithType, typename ImgSigT::ArithType, **HxBpoDot**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.199.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorDotV< DstSigT, ImgSigT >

Instantiator for binary pixel operation with dot product.

8.199.2 Member Data Documentation

8.199.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxBpoBind2Val<typename DstSigT::ArithType, typename ImgSigT::ArithType, HxBpoDot<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorDotV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoDotInst.c

8.200 HxInstantiatorEqual Class Template Reference

Instantiator for binary pixel operation with equal.

Public Attributes

- **HxImgFtorBpo**< DstSigT, ImgSigT, ImgSigT, **HxBpoEqual**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.200.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorEqual< DstSigT, ImgSigT >

Instantiator for binary pixel operation with equal.

8.200.2 Member Data Documentation

8.200.2.1 template<class DstSigT, class ImgSigT> HxImgFtorBpo<DstSigT, ImgSigT, ImgSigT, HxBpoEqual<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorEqual::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoEqualInst.c

8.201 HxInstantiatorEqualV Class Template Reference

Instantiator for binary pixel operation with equal.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxBpoBind2Val**< typename DstSigT::ArithType, typename ImgSigT::ArithType, **HxBpoEqual**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.201.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorEqualV< DstSigT, ImgSigT >

Instantiator for binary pixel operation with equal.

8.201.2 Member Data Documentation

8.201.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxBpoBind2Val<typename DstSigT::ArithType, typename ImgSigT::ArithType, HxBpoEqual<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorEqualV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoEqualInst.c

8.202 HxInstantiatorExp Class Template Reference

Instantiator for unary pixel operation with exponent.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoExp**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.202.1 Detailed Description

template<class ImgSigT> class HxInstantiatorExp< ImgSigT >

Instantiator for unary pixel operation with exponent.

8.202.2 Member Data Documentation

8.202.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoExp<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorExp::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoExpInst.c

8.203 HxInstantiatorExpPix Class Template Reference

Instantiator for export operation to native arrays.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxExportPix< typename ImgSigT::ArithType, DataT > > **f**

Instantiate image functor.

8.203.1 Detailed Description

template<class ImgSigT, class DataT> class HxInstantiatorExpPix< ImgSigT, DataT >

Instantiator for export operation to native arrays.

8.203.2 Member Data Documentation

8.203.2.1 template<class ImgSigT, class DataT> HxImgFtorInOut<ImgSigT, HxExportPix<typename ImgSigT::ArithType, DataT> > HxInstantiatorExpPix::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxExportPixInst.c

8.204 HxInstantiatorFloor Class Template Reference

Instantiator for unary pixel operation with floor.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoFloor**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.204.1 Detailed Description

template<class ImgSigT> class HxInstantiatorFloor< ImgSigT >

Instantiator for unary pixel operation with floor.

8.204.2 Member Data Documentation

8.204.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoFloor<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorFloor::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoFloorInst.c

8.205 HxInstantiatorGpi Class Template Reference

Instantiator for unary pixel operation with get pixel element.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, HxUpoGetPixElt< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.205.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorGpi< DstSigT, ImgSigT >

Instantiator for unary pixel operation with get pixel element.

8.205.2 Member Data Documentation

8.205.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoGetPixElt<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorGpi::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoGetPixEltInst.c

8.206 HxInstantiatorGreaterEqual Class Template Reference

Instantiator for binary pixel operation with greater equal.

Public Attributes

- **HxImgFtorBpo**< DstSigT, ImgSigT, ImgSigT, **HxBpoGreaterEqual**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.206.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorGreaterEqual< DstSigT, ImgSigT >

Instantiator for binary pixel operation with greater equal.

8.206.2 Member Data Documentation

8.206.2.1 template<class DstSigT, class ImgSigT> HxImgFtorBpo<DstSigT, ImgSigT, ImgSigT, HxBpoGreaterEqual<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorGreaterEqual::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoGreaterEqualInst.c

8.207 HxInstantiatorGreaterEqualV Class Template Reference

Instantiator for binary pixel operation with greater equal.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxBpoBind2Val**< typename DstSigT::ArithType, typename ImgSigT::ArithType, **HxBpoGreaterEqual**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.207.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorGreaterEqualV< DstSigT, ImgSigT >

Instantiator for binary pixel operation with greater equal.

8.207.2 Member Data Documentation

8.207.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxBpoBind2Val<typename DstSigT::ArithType, typename ImgSigT::ArithType, HxBpoGreaterEqual<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorGreaterEqualV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoGreaterEqualInst.c

8.208 HxInstantiatorGreaterThan Class Template Reference

Instantiator for binary pixel operation with greater than.

Public Attributes

- **HxImgFtorBpo**< DstSigT, ImgSigT, ImgSigT, **HxBpoGreaterThan**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.208.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorGreaterThan< DstSigT, ImgSigT >

Instantiator for binary pixel operation with greater than.

8.208.2 Member Data Documentation

8.208.2.1 template<class DstSigT, class ImgSigT> HxImgFtorBpo<DstSigT, ImgSigT, ImgSigT, HxBpoGreaterThan<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorGreaterThan::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoGreaterThanInst.c

8.209 HxInstantiatorGreaterThanV Class Template Reference

Instantiator for binary pixel operation with greater than.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxBpoBind2Val**< typename DstSigT::ArithType, typename ImgSigT::ArithType, **HxBpoGreaterThan**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.209.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorGreaterThanV< DstSigT, ImgSigT >

Instantiator for binary pixel operation with greater than.

8.209.2 Member Data Documentation

8.209.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxBpoBind2Val<typename DstSigT::ArithType, typename ImgSigT::ArithType, HxBpoGreaterThan<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorGreaterThanV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoGreaterThanInst.c

8.210 HxInstantiatorHighlightRegion Class Template Reference

Instantiator for binary pixel operation with region highlighting.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, LblSigT, **HxBpoHighlightRegion**< typename ImgSigT::ArithType, typename ImgSigT::ArithTypeDouble, typename LblSigT::ArithType > > **f**

  Instantiate image functor.

8.210.1 Detailed Description

template<class ImgSigT, class LblSigT> class HxInstantiatorHighlightRegion< ImgSigT, LblSigT >

Instantiator for binary pixel operation with region highlighting.

8.210.2 Member Data Documentation

8.210.2.1 template<class ImgSigT, class LblSigT> HxImgFtorBpo<ImgSigT, ImgSigT, LblSigT, HxBpoHighlightRegion<typename ImgSigT::ArithType, typename ImgSigT::ArithTypeDouble, typename LblSigT::ArithType> > HxInstantiatorHighlightRegion::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxHighlightRegion.c

8.211 HxInstantiatorImpPix Class Template Reference

Instantiator for import operation from native array.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxImportPix< typename ImgSigT::ArithType, DataT > > **f**
  Instantiate image functor.

8.211.1 Detailed Description

template<class ImgSigT, class DataT> class HxInstantiatorImpPix< ImgSigT, DataT >

Instantiator for import operation from native array.

8.211.2 Member Data Documentation

8.211.2.1 template<class ImgSigT, class DataT> HxImgFtorInOut<ImgSigT, HxImportPix<typename ImgSigT::ArithType, DataT> > HxInstantiatorImpPix::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxImportPixInst.c

8.212 HxInstantiatorInf Class Template Reference

Instantiator for binary pixel operation with infimum.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoInf**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**
  Instantiate image functor.

8.212.1 Detailed Description

template<class ImgSigT> class HxInstantiatorInf< ImgSigT >

Instantiator for binary pixel operation with infimum.

8.212.2 Member Data Documentation

8.212.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoInf<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorInf::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoInfInst.c

8.213 HxInstantiatorInfReduce Class Template Reference

Instantiator for reduce operation with infimum.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxReduceAdaptor< **HxBpoInfAssign**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.213.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorInfReduce**< **ImgSigT** >

Instantiator for reduce operation with infimum.

8.213.2 Member Data Documentation

8.213.2.1 template<class ImgSigT> HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoInfAssign<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorInfReduce::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxReduceInfAssignInst.c

8.214 HxInstantiatorInfV Class Template Reference

Instantiator for binary pixel operation with infimum.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoInf**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.214.1 Detailed Description

template<class ImgSigT> class HxInstantiatorInfV< ImgSigT >

Instantiator for binary pixel operation with infimum.

8.214.2 Member Data Documentation

8.214.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoInf<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorInfV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoInfInst.c

8.215 HxInstantiatorLeftShift Class Template Reference

Instantiator for binary pixel operation with left shift.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoLeftShift**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.215.1 Detailed Description

template<class ImgSigT> class HxInstantiatorLeftShift< ImgSigT >

Instantiator for binary pixel operation with left shift.

8.215.2 Member Data Documentation

8.215.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoLeftShift<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorLeftShift::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoLeftShiftInst.c

8.216 HxInstantiatorLeftShiftV Class Template Reference

Instantiator for binary pixel operation with left shift.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoLeftShift**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.216.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorLeftShiftV**< **ImgSigT** >

Instantiator for binary pixel operation with left shift.

8.216.2 Member Data Documentation

8.216.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoLeftShift<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorLeftShiftV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoLeftShiftInst.c

8.217 HxInstantiatorLessEqual Class Template Reference

Instantiator for binary pixel operation with less equal.

Public Attributes

- **HxImgFtorBpo**< DstSigT, ImgSigT, ImgSigT, **HxBpoLessEqual**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.217.1 Detailed Description

template<**class DstSigT, class ImgSigT**> **class HxInstantiatorLessEqual**< **DstSigT, ImgSigT** >

Instantiator for binary pixel operation with less equal.

8.217.2 Member Data Documentation

8.217.2.1 template<class DstSigT, class ImgSigT> HxImgFtorBpo<DstSigT, ImgSigT, ImgSigT, HxBpoLessEqual<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorLessEqual::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoLessEqualInst.c

8.218 HxInstantiatorLessEqualV Class Template Reference

Instantiator for binary pixel operation with less equal.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxBpoBind2Val**< typename DstSigT::ArithType, typename ImgSigT::ArithType, **HxBpoLessEqual**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.218.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorLessEqualV< DstSigT, ImgSigT >

Instantiator for binary pixel operation with less equal.

8.218.2 Member Data Documentation

8.218.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxBpoBind2Val<typename DstSigT::ArithType, typename ImgSigT::ArithType, HxBpoLessEqual<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorLessEqualV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoLessEqualInst.c

8.219 HxInstantiatorLessThan Class Template Reference

Instantiator for binary pixel operation with less than.

Public Attributes

- **HxImgFtorBpo**< DstSigT, ImgSigT, ImgSigT, **HxBpoLessThan**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.219.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorLessThan< DstSigT, ImgSigT >

Instantiator for binary pixel operation with less than.

8.219.2 Member Data Documentation

8.219.2.1 template<class DstSigT, class ImgSigT> HxImgFtorBpo<DstSigT, ImgSigT, ImgSigT, HxBpoLessThan<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorLessThan::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoLessThanInst.c

8.220 HxInstantiatorLessThanV Class Template Reference

Instantiator for binary pixel operation with less than.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxBpoBind2Val**< typename DstSigT::ArithType, typename ImgSigT::ArithType, **HxBpoLessThan**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.220.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorLessThanV< DstSigT, ImgSigT >

Instantiator for binary pixel operation with less than.

8.220.2 Member Data Documentation

8.220.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxBpoBind2Val<typename DstSigT::ArithType, typename ImgSigT::ArithType, HxBpoLessThan<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorLessThanV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoLessThanInst.c

8.221 HxInstantiatorLog Class Template Reference

Instantiator for unary pixel operation with natural logarithm.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoLog**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.221.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorLog**< **ImgSigT** >

Instantiator for unary pixel operation with natural logarithm.

8.221.2 Member Data Documentation

8.221.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoLog<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorLog::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoLogInst.c

8.222 HxInstantiatorLog10 Class Template Reference

Instantiator for unary pixel operation with base 10 logarithm.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoLog10**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

Instantiate image functor.

8.222.1 Detailed Description

template<class ImgSigT> class HxInstantiatorLog10< ImgSigT >

Instantiator for unary pixel operation with base 10 logarithm.

8.222.2 Member Data Documentation

8.222.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoLog10<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorLog10::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoLog10Inst.c

8.223 HxInstantiatorMax Class Template Reference

Instantiator for binary pixel operation with maximum.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoMax**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.223.1 Detailed Description

template<class ImgSigT> class HxInstantiatorMax< ImgSigT >

Instantiator for binary pixel operation with maximum.

8.223.2 Member Data Documentation

8.223.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoMax<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorMax::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoMaxInst.c

8.224 HxInstantiatorMaxReduce Class Template Reference

Instantiator for reduce operation with maximum.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxReduceAdaptor< **HxBpoMaxAssign**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.224.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorMaxReduce**< **ImgSigT** >

Instantiator for reduce operation with maximum.

8.224.2 Member Data Documentation

8.224.2.1 template<class ImgSigT> HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoMaxAssign<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorMaxReduce::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxReduceMaxAssignInst.c

8.225 HxInstantiatorMaxV Class Template Reference

Instantiator for binary pixel operation with maximum.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoMax**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.225.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorMaxV**< **ImgSigT** >

Instantiator for binary pixel operation with maximum.

8.225.2 Member Data Documentation

8.225.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoMax<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorMaxV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoMaxInst.c

8.226 HxInstantiatorMin Class Template Reference

Instantiator for binary pixel operation with minimum.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoMin**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.226.1 Detailed Description

template<class ImgSigT> class HxInstantiatorMin< ImgSigT >

Instantiator for binary pixel operation with minimum.

8.226.2 Member Data Documentation

8.226.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoMin<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorMin::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoMinInst.c

8.227 HxInstantiatorMinReduce Class Template Reference

Instantiator for reduce operation with minimum.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxReduceAdaptor< **HxBpoMinAssign**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.227.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorMinReduce**< **ImgSigT** >

Instantiator for reduce operation with minimum.

8.227.2 Member Data Documentation

8.227.2.1 template<class ImgSigT> HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoMinAssign<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorMinReduce::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxReduceMinAssignInst.c

8.228 HxInstantiatorMinV Class Template Reference

Instantiator for binary pixel operation with minimum.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoMin**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.228.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorMinV**< **ImgSigT** >

Instantiator for binary pixel operation with minimum.

8.228.2 Member Data Documentation

8.228.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoMin<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorMinV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoMinInst.c

8.229 HxInstantiatorMod Class Template Reference

Instantiator for binary pixel operation with modulo.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoMod**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.229.1 Detailed Description

template<class ImgSigT> class HxInstantiatorMod< ImgSigT >

Instantiator for binary pixel operation with modulo.

8.229.2 Member Data Documentation

8.229.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoMod<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorMod::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoModInst.c

8.230 HxInstantiatorModV Class Template Reference

Instantiator for binary pixel operation with modulo.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoMod**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.230.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorModV**< **ImgSigT** >

Instantiator for binary pixel operation with modulo.

8.230.2 Member Data Documentation

8.230.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoMod<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorModV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoModInst.c

8.231 HxInstantiatorMul Class Template Reference

Instantiator for binary pixel operation with multiplication.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoMul**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.231.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorMul**< **ImgSigT** >

Instantiator for binary pixel operation with multiplication.

8.231.2 Member Data Documentation

8.231.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoMul<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorMul::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoMulInst.c

8.232 HxInstantiatorMulReduce Class Template Reference

Instantiator for reduce operation with multiplication.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxReduceAdaptor< **HxBpoMulAssign**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.232.1 Detailed Description

template<class ImgSigT> class HxInstantiatorMulReduce< ImgSigT >

Instantiator for reduce operation with multiplication.

8.232.2 Member Data Documentation

8.232.2.1 template<class ImgSigT> HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoMulAssign<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorMulReduce::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxReduceMulAssignInst.c

8.233 HxInstantiatorMulV Class Template Reference

Instantiator for binary pixel operation with multiplication.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoMul**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.233.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorMulV**< **ImgSigT** >

Instantiator for binary pixel operation with multiplication.

8.233.2 Member Data Documentation

8.233.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoMul<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorMulV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoMulInst.c

8.234 HxInstantiatorNegate Class Template Reference

Instantiator for unary pixel operation with negation.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoNegate**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.234.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorNegate**< **ImgSigT** >

Instantiator for unary pixel operation with negation.

8.234.2 Member Data Documentation

8.234.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoNegate<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorNegate::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoNegateInst.c

8.235 HxInstantiatorNorm1 Class Template Reference

Instantiator for unary pixel operation with L1 norm.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoNorm1**< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**
  Instantiate image functor.

8.235.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorNorm1< DstSigT, ImgSigT >

Instantiator for unary pixel operation with L1 norm.

8.235.2 Member Data Documentation

8.235.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoNorm1<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorNorm1::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoNorm1Inst.c

8.236 HxInstantiatorNorm2 Class Template Reference

Instantiator for unary pixel operation with L2 norm.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoNorm2**< typename DstSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

Instantiate image functor.

8.236.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorNorm2< DstSigT, ImgSigT >

Instantiator for unary pixel operation with L2 norm.

8.236.2 Member Data Documentation

8.236.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoNorm2<typename DstSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorNorm2::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoNorm2Inst.c

8.237 HxInstantiatorNorm2Sqr Class Template Reference

Instantiator for unary pixel operation with squared L2 norm.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoNorm2Sqr**< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.237.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorNorm2Sqr< DstSigT, ImgSigT >

Instantiator for unary pixel operation with squared L2 norm.

8.237.2 Member Data Documentation

8.237.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoNorm2Sqr<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorNorm2Sqr::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoNorm2SqrInst.c

8.238 HxInstantiatorNormInf Class Template Reference

Instantiator for unary pixel operation with L inf norm.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoNormInf**< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.238.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorNormInf< DstSigT, ImgSigT >

Instantiator for unary pixel operation with L inf norm.

8.238.2 Member Data Documentation

8.238.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoNormInf<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorNormInf::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoNormInfInst.c

8.239 HxInstantiatorNotEqual Class Template Reference

Instantiator for binary pixel operation with not equal.

Public Attributes

- **HxImgFtorBpo**< DstSigT, ImgSigT, ImgSigT, **HxBpoNotEqual**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.239.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorNotEqual< DstSigT, ImgSigT >

Instantiator for binary pixel operation with not equal.

8.239.2 Member Data Documentation

8.239.2.1 template<class DstSigT, class ImgSigT> HxImgFtorBpo<DstSigT, ImgSigT, ImgSigT, HxBpoNotEqual<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorNotEqual::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoNotEqualInst.c

8.240 HxInstantiatorNotEqualV Class Template Reference

Instantiator for binary pixel operation with not equal.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxBpoBind2Val**< typename DstSigT::ArithType, typename ImgSigT::ArithType, **HxBpoNotEqual**< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.240.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorNotEqualV< DstSigT, ImgSigT >

Instantiator for binary pixel operation with not equal.

8.240.2 Member Data Documentation

8.240.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxBpoBind2Val<typename DstSigT::ArithType, typename ImgSigT::ArithType, HxBpoNotEqual<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorNotEqualV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoNotEqualInst.c

8.241 HxInstantiatorOr Class Template Reference

Instantiator for binary pixel operation with or.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoOr**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.241.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorOr**< **ImgSigT** >

Instantiator for binary pixel operation with or.

8.241.2 Member Data Documentation

8.241.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoOr<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorOr::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoOrInst.c

8.242 HxInstantiatorOrV Class Template Reference

Instantiator for binary pixel operation with or.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoOr**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.242.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorOrV**< **ImgSigT** >

Instantiator for binary pixel operation with or.

8.242.2 Member Data Documentation

8.242.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoOr<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorOrV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoOrInst.c

8.243 HxInstantiatorPow Class Template Reference

Instantiator for binary pixel operation with power.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoPow**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.243.1 Detailed Description

template<class ImgSigT> class HxInstantiatorPow< ImgSigT >

Instantiator for binary pixel operation with power.

8.243.2 Member Data Documentation

8.243.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoPow<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorPow::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoPowInst.c

8.244 HxInstantiatorPowV Class Template Reference

Instantiator for binary pixel operation with power.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoPow**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.244.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorPowV**< **ImgSigT** >

Instantiator for binary pixel operation with power.

8.244.2 Member Data Documentation

8.244.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoPow<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorPowV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoPowInst.c

8.245 HxInstantiatorProduct Class Template Reference

Instantiator for unary pixel operation with product.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoProduct**< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.245.1 Detailed Description

template<**class DstSigT, class ImgSigT**> **class HxInstantiatorProduct**< **DstSigT, ImgSigT** >

Instantiator for unary pixel operation with product.

8.245.2 Member Data Documentation

8.245.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoProduct<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorProduct::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoProductInst.c

8.246 HxInstantiatorRGB2Intensity Class Template Reference

Instantiator for unary pixel operation with **RGB2Intensity** (p. 1361).

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **RGB2Intensity**< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**
  Instantiate image functor.

8.246.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorRGB2Intensity< DstSigT, ImgSigT >

Instantiator for unary pixel operation with **RGB2Intensity** (p. 1361).

8.246.2 Member Data Documentation

8.246.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, RGB2Intensity<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorRGB2Intensity::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRGB2Intensity.c

8.247 HxInstantiatorRightShift Class Template Reference

Instantiator for binary pixel operation with right shift.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoRightShift**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

Instantiate image functor.

8.247.1 Detailed Description

template<class ImgSigT> class HxInstantiatorRightShift< ImgSigT >

Instantiator for binary pixel operation with right shift.

8.247.2 Member Data Documentation

8.247.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoRightShift<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorRightShift::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoRightShiftInst.c

8.248 HxInstantiatorRightShiftV Class Template Reference

Instantiator for binary pixel operation with right shift.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoRightShift**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.248.1 Detailed Description

template<class ImgSigT> class HxInstantiatorRightShiftV< ImgSigT >

Instantiator for binary pixel operation with right shift.

8.248.2 Member Data Documentation

8.248.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoRightShift<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorRightShiftV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoRightShiftInst.c

8.249 HxInstantiatorRound Class Template Reference

Instantiator for unary pixel operation with round.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoRound**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.249.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorRound**< **ImgSigT** >

Instantiator for unary pixel operation with round.

8.249.2 Member Data Documentation

8.249.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoRound<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorRound::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoRoundInst.c

8.250 HxInstantiatorSet Struct Template Reference

Instantiator for set operation.

`#include <HxImgFtorSetInst.h>`

Public Attributes

- **HxImgFtorSet**< **HxImageSig2dByte**, SrcSigT > **f001**

  Instantiate image functor for one image type.

- **HxImgFtorSet**< **HxImageSig2dShort**, SrcSigT > **f002**

  Instantiate image functor for one image type.

- **HxImgFtorSet**< **HxImageSig2dInt**, SrcSigT > **f003**

  Instantiate image functor for one image type.

- **HxImgFtorSet**< **HxImageSig2dFloat**, SrcSigT > **f004**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dDouble**, SrcSigT > **f005**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dVec2Byte**, SrcSigT > **f006**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dVec2Short**, SrcSigT > **f007**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dVec2Int**, SrcSigT > **f008**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dVec2Float**, SrcSigT > **f009**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dVec2Double**, SrcSigT > **f010**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dVec3Byte**, SrcSigT > **f011**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dVec3Short**, SrcSigT > **f012**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dVec3Int**, SrcSigT > **f013**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dVec3Float**, SrcSigT > **f014**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig2dVec3Double**, SrcSigT > **f015**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig3dByte**, SrcSigT > **f016**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig3dShort**, SrcSigT > **f017**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig3dInt**, SrcSigT > **f018**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig3dFloat**, SrcSigT > **f019**
  Instantiate image functor for one image type.
- **HxImgFtorSet**< **HxImageSig3dDouble**, SrcSigT > **f020**

Instantiate image functor for one image type.

- **HxImgFtorSet< HxImageSig2dComplex**, SrcSigT > **f021**
  Instantiate image functor for one image type.

8.250.1 Detailed Description

template<class SrcSigT> struct HxInstantiatorSet< SrcSigT >

Instantiator for set operation.

8.250.2 Member Data Documentation

8.250.2.1 template<class SrcSigT> HxImgFtorSet<HxImageSig2dByte, SrcSigT> HxInstantiatorSet::f001

Instantiate image functor for one image type.

8.250.2.2 template<class SrcSigT> HxImgFtorSet<HxImageSig2dShort, SrcSigT> HxInstantiatorSet::f002

Instantiate image functor for one image type.

8.250.2.3 template<class SrcSigT> HxImgFtorSet<HxImageSig2dInt, SrcSigT> HxInstantiatorSet::f003

Instantiate image functor for one image type.

8.250.2.4 template<class SrcSigT> HxImgFtorSet<HxImageSig2dFloat, SrcSigT> HxInstantiatorSet::f004

Instantiate image functor for one image type.

8.250.2.5 template<class SrcSigT> HxImgFtorSet<HxImageSig2dDouble, SrcSigT> HxInstantiatorSet::f005

Instantiate image functor for one image type.

8.250.2.6 template<class SrcSigT> HxImgFtorSet<HxImageSig2dVec2Byte, SrcSigT> HxInstantiatorSet::f006

Instantiate image functor for one image type.

8.250.2.7 template<class SrcSigT> HxImgFtorSet<HxImageSig2dVec2Short, SrcSigT> HxInstantiatorSet::f007

Instantiate image functor for one image type.

8.250.2.8 template<class SrcSigT> HxImgFtorSet<HxImageSig2dVec2Int, SrcSigT> HxInstantiatorSet::f008

Instantiate image functor for one image type.

8.250.2.9 template<class SrcSigT> HxImgFtorSet<HxImageSig2dVec2Float, SrcSigT> HxInstantiatorSet::f009

Instantiate image functor for one image type.

8.250.2.10 template<class SrcSigT> HxImgFtorSet<HxImageSig2dVec2Double, SrcSigT> HxInstantiatorSet::f010

Instantiate image functor for one image type.

8.250.2.11 template<class SrcSigT> HxImgFtorSet<HxImageSig2dVec3Byte, SrcSigT> HxInstantiatorSet::f011

Instantiate image functor for one image type.

8.250.2.12 template<class SrcSigT> HxImgFtorSet<HxImageSig2dVec3Short, SrcSigT> HxInstantiatorSet::f012

Instantiate image functor for one image type.

8.250.2.13 template<class SrcSigT> HxImgFtorSet<HxImageSig2dVec3Int, SrcSigT> HxInstantiatorSet::f013

Instantiate image functor for one image type.

8.250.2.14 template<class SrcSigT> HxImgFtorSet<HxImageSig2dVec3Float, SrcSigT> HxInstantiatorSet::f014

Instantiate image functor for one image type.

8.250.2.15 template<class SrcSigT> HxImgFtorSet<HxImageSig2dVec3Double, SrcSigT> HxInstantiatorSet::f015

Instantiate image functor for one image type.

8.250.2.16 template<class SrcSigT> HxImgFtorSet<HxImageSig3dByte, SrcSigT> HxInstantiatorSet::f016

Instantiate image functor for one image type.

8.250.2.17 template<class SrcSigT> HxImgFtorSet<HxImageSig3dShort, SrcSigT> HxInstantiatorSet::f017

Instantiate image functor for one image type.

8.250.2.18 template<class SrcSigT> HxImgFtorSet<HxImageSig3dInt, SrcSigT> HxInstantiatorSet::f018

Instantiate image functor for one image type.

8.250.2.19 template<class SrcSigT> HxImgFtorSet<HxImageSig3dFloat, SrcSigT> HxInstantiatorSet::f019

Instantiate image functor for one image type.

8.250.2.20 template<class SrcSigT> HxImgFtorSet<HxImageSig3dDouble, SrcSigT> HxInstantiatorSet::f020

Instantiate image functor for one image type.

8.250.2.21 template<class SrcSigT> HxImgFtorSet<HxImageSig2dComplex, SrcSigT> HxInstantiatorSet::f021

Instantiate image functor for one image type.

The documentation for this struct was generated from the following file:

- **HxImgFtorSetInst.h**

8.251 HxInstantiatorSetPartImg Struct Template Reference

Instantiator for unary pixel operation.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, HxUpoSetPartImage< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.251.1 Detailed Description

template<class ImgSigT> struct HxInstantiatorSetPartImg< ImgSigT >

Instantiator for unary pixel operation.

8.251.2 Member Data Documentation

8.251.2.1 template<class ImgSigT> HxImgFtorUpo< ImgSigT, ImgSigT, HxUpoSetPartImage<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorSetPartImg::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- **HxUpoSetPartImageInst.c**

8.252 HxInstantiatorSetVal Class Template Reference

Instantiator for inout operation to set values.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxInOutSetVal< typename ImgSigT::ArithType > > **f**
  Instantiate image functor.

8.252.1 Detailed Description

template<class ImgSigT> class HxInstantiatorSetVal< ImgSigT >

Instantiator for inout operation to set values.

8.252.2 Member Data Documentation

8.252.2.1 template<class ImgSigT> HxImgFtorInOut<ImgSigT, HxInOutSetVal<typename ImgSigT::ArithType> > HxInstantiatorSetVal::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxInOutSetValInst.c

8.253 HxInstantiatorSin Class Template Reference

Instantiator for unary pixel operation with sine.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoSin**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**
  Instantiate image functor.

8.253.1 Detailed Description

template<class ImgSigT> class HxInstantiatorSin< ImgSigT >

Instantiator for unary pixel operation with sine.

8.253.2 Member Data Documentation

8.253.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoSin<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorSin::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoSinInst.c

8.254 HxInstantiatorSinh Class Template Reference

Instantiator for unary pixel operation with hyperbolic sine.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoSinh**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.254.1 Detailed Description

template<class ImgSigT> class HxInstantiatorSinh< ImgSigT >

Instantiator for unary pixel operation with hyperbolic sine.

8.254.2 Member Data Documentation

8.254.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoSinh<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorSinh::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoSinhInst.c

8.255 HxInstantiatorSpi Class Template Reference

Instantiator for binary pixel operation with set pixel element.

Public Attributes

- **HxImgFtorBpo**< DstSigT, DstSigT, ImgSigT, HxBpoSetPixElt< typename DstSigT::ArithType, typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.255.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorSpi< DstSigT, ImgSigT >

Instantiator for binary pixel operation with set pixel element.

8.255.2 Member Data Documentation

8.255.2.1 template<class DstSigT, class ImgSigT> HxImgFtorBpo<DstSigT, DstSigT, ImgSigT, HxBpoSetPixElt<typename DstSigT::ArithType, typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorSpi::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoSetPixEltInst.c

8.256 HxInstantiatorSqrDst Struct Template Reference

Instantiator for binary pixel operation with squared distance.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoSqrDst**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.256.1 Detailed Description

template<class ImgSigT> struct HxInstantiatorSqrDst< ImgSigT >

Instantiator for binary pixel operation with squared distance.

8.256.2 Member Data Documentation

8.256.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoSqrDst<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorSqrDst::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxSquaredDistance.c

8.257 HxInstantiatorSqrt Class Template Reference

Instantiator for unary pixel operation with square root.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoSqrt**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.257.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorSqrt**< **ImgSigT** >

Instantiator for unary pixel operation with square root.

8.257.2 Member Data Documentation

8.257.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoSqrt<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorSqrt::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoSqrtInst.c

8.258 HxInstantiatorSub Class Template Reference

Instantiator for binary pixel operation with subtraction.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoSub**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.258.1 Detailed Description

template<class ImgSigT> class HxInstantiatorSub< ImgSigT >

Instantiator for binary pixel operation with subtraction.

8.258.2 Member Data Documentation

8.258.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoSub<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorSub::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoSubInst.c

8.259 HxInstantiatorSubSat Struct Template Reference

Instantiator for binary pixel operation with squared distance.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoSubSat**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.259.1 Detailed Description

template<class ImgSigT> struct HxInstantiatorSubSat< ImgSigT >

Instantiator for binary pixel operation with squared distance.

8.259.2 Member Data Documentation

8.259.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoSubSat<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorSubSat::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxSubSat.c

8.260 HxInstantiatorSubV Class Template Reference

Instantiator for binary pixel operation with subtraction.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoSub**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.260.1 Detailed Description

template<class ImgSigT> class HxInstantiatorSubV< ImgSigT >

Instantiator for binary pixel operation with subtraction.

8.260.2 Member Data Documentation

8.260.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoSub<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorSubV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoSubInst.c

8.261 HxInstantiatorSum Class Template Reference

Instantiator for unary pixel operation with sum.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoSum**< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.261.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorSum< DstSigT, ImgSigT >

Instantiator for unary pixel operation with sum.

8.261.2 Member Data Documentation

8.261.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoSum<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorSum::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoSumInst.c

8.262 HxInstantiatorSup Class Template Reference

Instantiator for binary pixel operation with supremum.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoSup**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.262.1 Detailed Description

template<class ImgSigT> class HxInstantiatorSup< ImgSigT >

Instantiator for binary pixel operation with supremum.

8.262.2 Member Data Documentation

8.262.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoSup<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorSup::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoSupInst.c

8.263 HxInstantiatorSupReduce Class Template Reference

Instantiator for reduce operation with supremum.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxReduceAdaptor< **HxBpoSupAssign**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

Instantiate image functor.

8.263.1 Detailed Description

template<class ImgSigT> class HxInstantiatorSupReduce< ImgSigT >

Instantiator for reduce operation with supremum.

8.263.2 Member Data Documentation

8.263.2.1 template<class ImgSigT> HxImgFtorInOut< ImgSigT, HxReduceAdaptor< HxBpoSupAssign<typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorSupReduce::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxReduceSupAssignInst.c

8.264 HxInstantiatorSupV Class Template Reference

Instantiator for binary pixel operation with supremum.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoSup**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.264.1 Detailed Description

template<class ImgSigT> class HxInstantiatorSupV< ImgSigT >

Instantiator for binary pixel operation with supremum.

8.264.2 Member Data Documentation

8.264.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoSup<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorSupV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoSupInst.c

8.265 HxInstantiatorTan Class Template Reference

Instantiator for unary pixel operation with tangent.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoTan**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.265.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorTan**< **ImgSigT** >

Instantiator for unary pixel operation with tangent.

8.265.2 Member Data Documentation

8.265.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoTan<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorTan::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoTanInst.c

8.266 HxInstantiatorTanh Class Template Reference

Instantiator for unary pixel operation with hyperbolic tangent.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoTanh**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.266.1 Detailed Description

template<**class ImgSigT**> **class HxInstantiatorTanh**< **ImgSigT** >

Instantiator for unary pixel operation with hyperbolic tangent.

8.266.2 Member Data Documentation

8.266.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoTanh<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType> > HxInstantiatorTanh::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoTanhInst.c

8.267 HxInstantiatorTriStateThreshold Struct Template Reference

Instantiator for unary pixel operation with tri state threshold.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxUpoTriStateThreshold**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.267.1 Detailed Description

template<class ImgSigT> struct HxInstantiatorTriStateThreshold< ImgSigT >

Instantiator for unary pixel operation with tri state threshold.

8.267.2 Member Data Documentation

8.267.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxUpoTriStateThreshold< typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorTriStateThreshold::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxTriStateThreshold.c

8.268 HxInstantiatorUpoMax Class Template Reference

Instantiator for unary pixel operation with unary maximum.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoMax**< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**

Instantiate image functor.

8.268.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorUpoMax< DstSigT, ImgSigT >

Instantiator for unary pixel operation with unary maximum.

8.268.2 Member Data Documentation

8.268.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoMax<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorUpoMax::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoMaxInst.c

8.269 HxInstantiatorUpoMin Class Template Reference

Instantiator for unary pixel operation with unary minimum.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, **HxUpoMin**< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.269.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorUpoMin< DstSigT, ImgSigT >

Instantiator for unary pixel operation with unary minimum.

8.269.2 Member Data Documentation

8.269.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoMin<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorUpoMin::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoMinInst.c

8.270 HxInstantiatorUpoThreshold Class Template Reference

Instantiator for unary pixel operation with threshold.

Public Attributes

- **HxImgFtorUpo**< DstSigT, ImgSigT, HxUpoThreshold< typename DstSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.270.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorUpoThreshold< DstSigT, ImgSigT >

Instantiator for unary pixel operation with threshold.

8.270.2 Member Data Documentation

8.270.2.1 template<class DstSigT, class ImgSigT> HxImgFtorUpo<DstSigT, ImgSigT, HxUpoThreshold<typename DstSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorUpoThreshold::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxUpoThresholdInst.c

8.271 HxInstantiatorVec2 Class Template Reference

Instantiator for binary pixel operation with vec2.

Public Attributes

- **HxImgFtorBpo**< DstSigT, ImgSigT, ImgSigT, HxBpoVec2< typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.271.1 Detailed Description

template<class DstSigT, class ImgSigT> class HxInstantiatorVec2< DstSigT, ImgSigT >

Instantiator for binary pixel operation with vec2.

8.271.2 Member Data Documentation

8.271.2.1 template<class DstSigT, class ImgSigT> HxImgFtorBpo<DstSigT, ImgSigT, ImgSigT, HxBpoVec2<typename DstSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorVec2::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoVec2Inst.c

8.272 HxInstantiatorVec3 Class Template Reference

Instantiator for multi pixel operation with vec3.

Public Attributes

- **HxImgFtorMpo**< DstSigT, SrcsSigT, HxMpoVec3< typename DstSigT::ArithType, typename SrcsSigT::ArithType > > **f**
  Instantiate image functor.

8.272.1 Detailed Description

template<class DstSigT, class SrcsSigT> class HxInstantiatorVec3< DstSigT, SrcsSigT >

Instantiator for multi pixel operation with vec3.

8.272.2 Member Data Documentation

8.272.2.1 template<class DstSigT, class SrcsSigT> HxImgFtorMpo<DstSigT, SrcsSigT, HxMpoVec3<typename DstSigT::ArithType, typename SrcsSigT::ArithType> > HxInstantiatorVec3::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxMpoVec3Inst.c

8.273 HxInstantiatorXor Class Template Reference

Instantiator for binary pixel operation with exclusive or.

Public Attributes

- **HxImgFtorBpo**< ImgSigT, ImgSigT, ImgSigT, **HxBpoXor**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

Instantiate image functor.

8.273.1 Detailed Description

template<class ImgSigT> class HxInstantiatorXor< ImgSigT >

Instantiator for binary pixel operation with exclusive or.

8.273.2 Member Data Documentation

8.273.2.1 template<class ImgSigT> HxImgFtorBpo<ImgSigT, ImgSigT, ImgSigT, HxBpoXor<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > HxInstantiatorXor::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoXorInst.c

8.274 HxInstantiatorXorV Class Template Reference

Instantiator for binary pixel operation with exclusive or.

Public Attributes

- **HxImgFtorUpo**< ImgSigT, ImgSigT, **HxBpoBind2Val**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, **HxBpoXor**< typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType > > > **f**

  Instantiate image functor.

8.274.1 Detailed Description

template<class ImgSigT> class HxInstantiatorXorV< ImgSigT >

Instantiator for binary pixel operation with exclusive or.

8.274.2 Member Data Documentation

8.274.2.1 template<class ImgSigT> HxImgFtorUpo<ImgSigT, ImgSigT, HxBpoBind2Val<typename ImgSigT::ArithType, typename ImgSigT::ArithType, HxBpoXor<typename ImgSigT::ArithType, typename ImgSigT::ArithType, typename ImgSigT::ArithType> > > HxInstantiatorXorV::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxBpoXorInst.c

8.275 HxInstDiyTranspose Class Template Reference

Instantiator for DIY operation with transpose.

Public Attributes

- **HxImgFtorDiy**< ImgSigT, ImgSigT, **HxDiyTranspose**< typename ImgSigT::DataPtrType, typename ImgSigT::DataPtrType > > **f**

  Instantiate image functor.

8.275.1 Detailed Description

template<class ImgSigT> class HxInstDiyTranspose< ImgSigT >

Instantiator for DIY operation with transpose.

8.275.2 Member Data Documentation

8.275.2.1 template<class ImgSigT> HxImgFtorDiy< ImgSigT, ImgSigT, HxDiyTranspose<typename ImgSigT::DataPtrType, typename ImgSigT::DataPtrType> > HxInstDiyTranspose::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- **HxTranspose.c**

8.276 HxInstExportExtraIdentMaskCentralMoments Struct Template Reference

Instantiator for export extra operation with identification mask central moments.

Public Attributes

- **HxImgFtorExportExtra**< ImgSigT, ExtraImSigT, **HxExportExtraIdentMaskCentralMoments**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > **f**

  Instantiate image functor.

8.276.1 Detailed Description

template<class ImgSigT, class ExtraImSigT> struct HxInstExportExtraIdentMaskCentralMoments< ImgSigT, ExtraImSigT >

Instantiator for export extra operation with identification mask central moments.

8.276.2 Member Data Documentation

8.276.2.1 template<class ImgSigT, class ExtraImSigT> HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskCentralMoments<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > HxInstExportExtraIdentMaskCentralMoments::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxExportExtraIdentMaskCentralMomentsInst.c

8.277 HxInstExportExtraIdentMaskMean Struct Template Reference

Instantiator for export extra operation with identification mask mean.

Public Attributes

- **HxImgFtorExportExtra**< ImgSigT, ExtraImSigT, **HxExportExtraIdentMaskMean**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > **f**

  Instantiate image functor.

8.277.1 Detailed Description

template<class ImgSigT, class ExtraImSigT> struct HxInstExportExtraIdentMaskMean< ImgSigT, ExtraImSigT >

Instantiator for export extra operation with identification mask mean.

8.277.2 Member Data Documentation

8.277.2.1 template<class ImgSigT, class ExtraImSigT> HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskMean<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > HxInstExportExtraIdentMaskMean::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxExportExtraIdentMaskMeanInst.c

8.278 HxInstExportExtraIdentMaskMedian Struct Template Reference

Instantiator for export extra operation with identification mask median.

Public Attributes

- **HxImgFtorExportExtra**< ImgSigT, ExtraImSigT, **HxExportExtraIdentMaskMedian**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > **f**

  Instantiate image functor.

8.278.1 Detailed Description

template<class ImgSigT, class ExtraImSigT> struct HxInstExportExtraIdentMaskMedian< ImgSigT, ExtraImSigT >

Instantiator for export extra operation with identification mask median.

8.278.2 Member Data Documentation

8.278.2.1 template<class ImgSigT, class ExtraImSigT> HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskMedian<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > HxInstExportExtraIdentMaskMedian::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxExportExtraIdentMaskMedianInst.c

8.279 HxInstExportExtraIdentMaskMoments Struct Template Reference

Instantiator for export extra operation with identification mask moments.

Public Attributes

- **HxImgFtorExportExtra**< ImgSigT, ExtraImSigT, **HxExportExtraIdentMaskMoments**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > **f**

Instantiate image functor.

8.279.1 Detailed Description

template<class ImgSigT, class ExtraImSigT> struct HxInstExportExtraIdentMaskMoments< ImgSigT, ExtraImSigT >

Instantiator for export extra operation with identification mask moments.

8.279.2 Member Data Documentation

8.279.2.1 template<class ImgSigT, class ExtraImSigT> HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskMoments<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > HxInstExportExtraIdentMaskMoments::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxExportExtraIdentMaskMomentsInst.c

8.280 HxInstExportExtraIdentMaskStdev Struct Template Reference

Instantiator for export extra operation with identification mask standard deviation.

Public Attributes

- **HxImgFtorExportExtra**< ImgSigT, ExtraImSigT, **HxExportExtraIdentMaskStdev**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > **f**

  Instantiate image functor.

8.280.1 Detailed Description

template<class ImgSigT, class ExtraImSigT> struct HxInstExportExtraIdentMaskStdev< ImgSigT, ExtraImSigT >

Instantiator for export extra operation with identification mask standard deviation.

8.280.2 Member Data Documentation

8.280.2.1 template<class ImgSigT, class ExtraImSigT> HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskStdev<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > HxInstExportExtraIdentMaskStdev::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxExportExtraIdentMaskStdevInst.c

8.281 HxInstExportExtraIdentMaskSum Struct Template Reference

Instantiator for export extra operation with identification mask summation.

Public Attributes

- **HxImgFtorExportExtra**< ImgSigT, ExtraImSigT, **HxExportExtraIdentMaskSum**< typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > **f**

  Instantiate image functor.

8.281.1 Detailed Description

template<class ImgSigT, class ExtraImSigT> struct HxInstExportExtraIdentMaskSum< ImgSigT, ExtraImSigT >

Instantiator for export extra operation with identification mask summation.

8.281.2 Member Data Documentation

8.281.2.1 template<class ImgSigT, class ExtraImSigT> HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraIdentMaskSum<typename ImgSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > HxInstExportExtraIdentMaskSum::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxExportExtraIdentMaskSumInst.c

8.282 HxInstExportExtraWeightMaskSum Struct Template Reference

Instantiator for export extra operation with weight mask summation.

Public Attributes

- **HxImgFtorExportExtra**< ImgSigT, ExtraImSigT, **HxExportExtraWeightMaskSum**< typename ExtraImSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > **f**

  Instantiate image functor.

8.282.1 Detailed Description

template<**class ImgSigT, class ExtraImSigT**> **struct HxInstExportExtraWeightMaskSum**< **ImgSigT, ExtraImSigT** >

Instantiator for export extra operation with weight mask summation.

8.282.2 Member Data Documentation

8.282.2.1 template<class ImgSigT, class ExtraImSigT> HxImgFtorExportExtra< ImgSigT, ExtraImSigT, HxExportExtraWeightMaskSum<typename ExtraImSigT::ArithTypeDouble, typename ImgSigT::ArithType, typename ExtraImSigT::ArithType > > HxInstExportExtraWeightMaskSum::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxExportExtraWeightMaskSumInst.c

8.283 HxInstExpPpm Class Template Reference

Instantiator for export operation to ppm format.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxExportPpm< typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.283.1 Detailed Description

template<**class ImgSigT**> **class HxInstExpPpm**< **ImgSigT** >

Instantiator for export operation to ppm format.

8.283.2 Member Data Documentation

8.283.2.1 template<class ImgSigT> HxImgFtorInOut<ImgSigT, HxExportPpm<typename ImgSigT::ArithType> > HxInstExpPpm::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxExportPpmInst.c

8.284 HxInstGenConv2dAddInf Class Template Reference

Instantiator for generalized convolution operation on 2d images with addition and infimum as basic operations using a 2d kernel.

Public Attributes

- **HxImgFtorGenConv2d**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoInfAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel2d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.284.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dAddInf< ImgSigT, KerSigT >

Instantiator for generalized convolution operation on 2d images with addition and infimum as basic operations using a 2d kernel.

8.284.2 Member Data Documentation

8.284.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2d< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoInfAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel2d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dAddInf::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddInfInst.c

8.285 HxInstGenConv2dAddMax Class Template Reference

Instantiator for generalized convolution operation on 2d images with addition and maximum as basic operations using a 2d kernel.

Public Attributes

- **HxImgFtorGenConv2d**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoMaxAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel2d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.285.1 Detailed Description

template<**class ImgSigT, class KerSigT**> **class HxInstGenConv2dAddMax**< **ImgSigT, KerSigT** >

Instantiator for generalized convolution operation on 2d images with addition and maximum as basic operations using a 2d kernel.

8.285.2 Member Data Documentation

8.285.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2d< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoMaxAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel2d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dAddMax::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddMaxInst.c

8.286 HxInstGenConv2dAddMin Class Template Reference

Instantiator for generalized convolution operation on 2d images with addition and minimum as basic operations using a 2d kernel.

Public Attributes

- **HxImgFtorGenConv2d**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoMinAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel2d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.286.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dAddMin< ImgSigT, KerSigT >

Instantiator for generalized convolution operation on 2d images with addition and minimum as basic operations using a 2d kernel.

8.286.2 Member Data Documentation

8.286.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2d< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoMinAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel2d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dAddMin::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddMinInst.c

8.287 HxInstGenConv2dAddSup Class Template Reference

Instantiator for generalized convolution operation on 2d images with addition and supremum as basic operations using a 2d kernel.

Public Attributes

- **HxImgFtorGenConv2d**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoSupAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel2d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.287.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dAddSup< ImgSigT, KerSigT >

Instantiator for generalized convolution operation on 2d images with addition and supremum as basic operations using a 2d kernel.

8.287.2 Member Data Documentation

8.287.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2d< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoSupAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel2d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dAddSup::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddSupInst.c

8.288 HxInstGenConv2dK1dAddInf Class Template Reference

Instantiator for generalized convolution operation on 2d images with addition and infimum as basic operations using a 1d kernel.

Public Attributes

- **HxImgFtorGenConv2dK1d**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoInfAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.288.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dK1dAddInf< ImgSigT, KerSigT >

Instantiator for generalized convolution operation on 2d images with addition and infimum as basic operations using a 1d kernel.

8.288.2 Member Data Documentation

8.288.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2dK1d< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoInfAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dK1dAddInf::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddInfInst.c

8.289 HxInstGenConv2dK1dAddMax Class Template Reference

Instantiator for generalized convolution operation on 2d images with addition and maximum as basic operations using a 1d kernel.

Public Attributes

- **HxImgFtorGenConv2dK1d**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoMaxAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.289.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dK1dAddMax< ImgSigT, KerSigT >

Instantiator for generalized convolution operation on 2d images with addition and maximum as basic operations using a 1d kernel.

8.289.2 Member Data Documentation

8.289.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2dK1d< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoMaxAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dK1dAddMax::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddMaxInst.c

8.290 HxInstGenConv2dK1dAddMin Class Template Reference

Instantiator for generalized convolution operation on 2d images with addition and minimum as basic operations using a 1d kernel.

Public Attributes

- **HxImgFtorGenConv2dK1d**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoMinAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

Instantiate image functor.

8.290.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dK1dAddMin< ImgSigT, KerSigT >

Instantiator for generalized convolution operation on 2d images with addition and minimum as basic operations using a 1d kernel.

8.290.2 Member Data Documentation

8.290.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2dK1d< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoMinAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dK1dAddMin::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddMinInst.c

8.291 HxInstGenConv2dK1dAddSup Class Template Reference

Instantiator for generalized convolution operation on 2d images with addition and supremum as basic operations using a 1d kernel.

Public Attributes

- **HxImgFtorGenConv2dK1d**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoSupAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.291.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dK1dAddSup< ImgSigT, KerSigT >

Instantiator for generalized convolution operation on 2d images with addition and supremum as basic operations using a 1d kernel.

8.291.2 Member Data Documentation

8.291.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2dK1d< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoSupAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dK1dAddSup::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddSupInst.c

8.292 HxInstGenConv2dK1dMulAdd Class Template Reference

Instantiator for generalized convolution operation on 2d images with multiplication and addition as basic operations using a 1d kernel.

Public Attributes

- **HxImgFtorGenConv2dK1d**< ImgSigT, KerSigT, KerSigT, **HxBpoMul**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoAddAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.292.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dK1dMulAdd< ImgSigT, KerSigT >

Instantiator for generalized convolution operation on 2d images with multiplication and addition as basic operations using a 1d kernel.

8.292.2 Member Data Documentation

8.292.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2dK1d< ImgSigT, KerSigT, KerSigT, HxBpoMul<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoAddAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dK1dMulAdd::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvMulAddInst.c

8.293 HxInstGenConv2dMulAdd Class Template Reference

Instantiator for generalized convolution operation on 2d images with multiplication and addition as basic operations using a 2d kernel.

Public Attributes

- **HxImgFtorGenConv2d**< ImgSigT, KerSigT, KerSigT, **HxBpoMul**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoAddAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel2d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.293.1 Detailed Description

template<**class ImgSigT, class KerSigT**> **class HxInstGenConv2dMulAdd**< **ImgSigT, KerSigT** >

Instantiator for generalized convolution operation on 2d images with multiplication and addition as basic operations using a 2d kernel.

8.293.2 Member Data Documentation

8.293.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2d< ImgSigT, KerSigT, KerSigT, HxBpoMul<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoAddAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel2d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dMulAdd::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvMulAddInst.c

8.294 HxInstGenConv2dSepAddInf Class Template Reference

Instantiator for separable generalized convolution operation on 2d images with addition and infimum as basic operations using two 1d kernels.

Public Attributes

- **HxImgFtorGenConv2dSep**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoInfAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.294.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dSepAddInf< ImgSigT, KerSigT >

Instantiator for separable generalized convolution operation on 2d images with addition and infimum as basic operations using two 1d kernels.

8.294.2 Member Data Documentation

8.294.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoInfAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dSepAddInf::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddInfInst.c

8.295 HxInstGenConv2dSepAddMax Class Template Reference

Instantiator for separable generalized convolution operation on 2d images with addition and maximum as basic operations using two 1d kernels.

Public Attributes

- **HxImgFtorGenConv2dSep**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoMaxAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.295.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dSepAddMax< ImgSigT, KerSigT >

Instantiator for separable generalized convolution operation on 2d images with addition and maximum as basic operations using two 1d kernels.

8.295.2 Member Data Documentation

8.295.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoMaxAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dSepAddMax::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddMaxInst.c

8.296 HxInstGenConv2dSepAddMin Class Template Reference

Instantiator for separable generalized convolution operation on 2d images with addition and minimum as basic operations using two 1d kernels.

Public Attributes

- **HxImgFtorGenConv2dSep**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoMinAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.296.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dSepAddMin< ImgSigT, KerSigT >

Instantiator for separable generalized convolution operation on 2d images with addition and minimum as basic operations using two 1d kernels.

8.296.2 Member Data Documentation

8.296.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoMinAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dSepAddMin::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddMinInst.c

8.297 HxInstGenConv2dSepAddSup Class Template Reference

Instantiator for separable generalized convolution operation on 2d images with addition and supremum as basic operations using two 1d kernels.

Public Attributes

- **HxImgFtorGenConv2dSep**< ImgSigT, KerSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoSupAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.297.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dSepAddSup< ImgSigT, KerSigT >

Instantiator for separable generalized convolution operation on 2d images with addition and supremum as basic operations using two 1d kernels.

8.297.2 Member Data Documentation

8.297.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoSupAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dSepAddSup::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvAddSupInst.c

8.298 HxInstGenConv2dSepMulAdd Class Template Reference

Instantiator for separable generalized convolution operation on 2d images with multiplication and addition as basic operations using two 1d kernels.

Public Attributes

- **HxImgFtorGenConv2dSep**< ImgSigT, KerSigT, KerSigT, **HxBpoMul**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoAddAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

Instantiate image functor.

8.298.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv2dSepMulAdd< ImgSigT, KerSigT >

Instantiator for separable generalized convolution operation on 2d images with multiplication and addition as basic operations using two 1d kernels.

8.298.2 Member Data Documentation

8.298.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv2dSep< ImgSigT, KerSigT, KerSigT, HxBpoMul<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoAddAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv2dSepMulAdd::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvMulAddInst.c

8.299 HxInstGenConv3dK1dMulAdd Class Template Reference

Instantiator for generalized convolution operation on 3d images with multiplication and addition as basic operations using a 1d kernel.

Public Attributes

- **HxImgFtorGenConv3dK1d**< DstSigT, SrcSigT, KerSigT, **HxBpoMul**< typename KerSigT::ArithType, typename SrcSigT::ArithType, typename KerSigT::ArithType >, **HxBpoAddAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel1d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.299.1 Detailed Description

template<class DstSigT, class SrcSigT, class KerSigT> class HxInstGenConv3dK1dMulAdd< DstSigT, SrcSigT, KerSigT >

Instantiator for generalized convolution operation on 3d images with multiplication and addition as basic operations using a 1d kernel.

8.299.2 Member Data Documentation

8.299.2.1 template<class DstSigT, class SrcSigT, class KerSigT> HxImgFtorGenConv3dK1d< DstSigT, SrcSigT, KerSigT, HxBpoMul<typename KerSigT::ArithType, typename SrcSigT::ArithType, typename KerSigT::ArithType>, HxBpoAddAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel1d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv3dK1dMulAdd::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvMulAddInst.c

8.300 HxInstGenConv3dMulAdd Class Template Reference

Instantiator for generalized convolution operation on 3d images with multiplication and addition as basic operations using a 3d kernel.

Public Attributes

- **HxImgFtorGenConv3d**< ImgSigT, KerSigT, KerSigT, **HxBpoMul**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoAddAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxKernel3d**< typename KerSigT::DataPtrType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.300.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstGenConv3dMulAdd< ImgSigT, KerSigT >

Instantiator for generalized convolution operation on 3d images with multiplication and addition as basic operations using a 3d kernel.

8.300.2 Member Data Documentation

8.300.2.1 template<class ImgSigT, class KerSigT> HxImgFtorGenConv3d< ImgSigT, KerSigT, KerSigT, HxBpoMul<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoAddAssign<typename KerSigT::ArithType, typename KerSigT::ArithType>, HxKernel3d<typename KerSigT::DataPtrType, typename KerSigT::ArithType> > HxInstGenConv3dMulAdd::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGenConvMulAddInst.c

8.301 HxInstGeneratePix Class Template Reference

Instantiator for inout operation to generate pixels.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxGeneratePix< typename ImgSigT::ArithType > > **f**
  Instantiate image functor.

8.301.1 Detailed Description

template<**class ImgSigT**> **class HxInstGeneratePix**< **ImgSigT** >

Instantiator for inout operation to generate pixels.

8.301.2 Member Data Documentation

8.301.2.1 template<class ImgSigT> HxImgFtorInOut<ImgSigT, HxGeneratePix<typename ImgSigT::ArithType> > HxInstGeneratePix::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxGeneratePixInst.c

8.302 HxInstImpBytes Class Template Reference

Instantiator for import operation from bytes.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxImportBytes< typename ImgSigT::ArithType > > **f**
  Instantiate image functor.

8.302.1 Detailed Description

template<**class ImgSigT**> **class HxInstImpBytes**< **ImgSigT** >

Instantiator for import operation from bytes.

8.302.2 Member Data Documentation

8.302.2.1 template<class ImgSigT> HxImgFtorInOut<ImgSigT, HxImportBytes<typename ImgSigT::ArithType> > HxInstImpBytes::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxImportBytesInst.c

8.303 HxInstImpPackRgb Class Template Reference

Instantiator for import operation from rgb array.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxImportPackedRgb< typename ImgSigT::ArithType > > **f**
  Instantiate image functor.

8.303.1 Detailed Description

template<class ImgSigT> class HxInstImpPackRgb< ImgSigT >

Instantiator for import operation from rgb array.

8.303.2 Member Data Documentation

8.303.2.1 template<class ImgSigT> HxImgFtorInOut<ImgSigT, HxImportPackedRgb<typename ImgSigT::ArithType> > HxInstImpPackRgb::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxImportPackedRgbInst.c

8.304 HxInstImpPpm Class Template Reference

Instantiator for import operation from ppm format.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxImportPpm< typename ImgSigT::ArithType > > **f**
  Instantiate image functor.

8.304.1 Detailed Description

template<class ImgSigT> class HxInstImpPpm< ImgSigT >

Instantiator for import operation from ppm format.

8.304.2 Member Data Documentation

8.304.2.1 template<class ImgSigT> HxImgFtorInOut<ImgSigT, HxImportPpm<typename ImgSigT::ArithType> > HxInstImpPpm::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxImportPpmInst.c

8.305 HxInstInOutGetPoints Class Template Reference

Instantiator for inout operation to get points.

Public Attributes

- **HxImgFtorInOut**< ImgSigT, HxInOutGetPoints< typename ImgSigT::ArithType > > **f**
  Instantiate image functor.

8.305.1 Detailed Description

template<class ImgSigT> class HxInstInOutGetPoints< ImgSigT >

Instantiator for inout operation to get points.

8.305.2 Member Data Documentation

8.305.2.1 template<class ImgSigT> HxImgFtorInOut<ImgSigT, HxInOutGetPoints<typename ImgSigT::ArithType> > HxInstInOutGetPoints::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxInOutGetPointsInst.c

8.306 HxInstKerNgb2dNormCorrelation Class Template Reference

Instantiator for kernel based neighbourhood operation with normalized correlation.

Public Attributes

- **HxImgFtorKernelNgb2d**< DstSigT, SrcSigT, KerSigT, **HxKerNgbNormCorrelation**< typename SrcSigT::ArithType, typename DstSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.306.1 Detailed Description

template<class DstSigT, class SrcSigT, class KerSigT> class HxInstKerNgb2dNormCorrelation< DstSigT, SrcSigT, KerSigT >

Instantiator for kernel based neighbourhood operation with normalized correlation.

8.306.2 Member Data Documentation

8.306.2.1 template<class DstSigT, class SrcSigT, class KerSigT> HxImgFtorKernelNgb2d< DstSigT, SrcSigT, KerSigT, HxKerNgbNormCorrelation<typename SrcSigT::ArithType, typename DstSigT::ArithTypeDouble> > HxInstKerNgb2dNormCorrelation::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxKerNgbNormCorrelationInst.c

8.307 HxInstNgb2dMean Class Template Reference

Instantiator for neighbourhood operation with mean.

Public Attributes

- **HxImgFtorNgb2d**< ResSigT, ImgSigT, HxNgbMean< typename ResSigT::ArithType, typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.307.1 Detailed Description

template<class ResSigT, class ImgSigT> class HxInstNgb2dMean< ResSigT, ImgSigT >

Instantiator for neighbourhood operation with mean.

8.307.2 Member Data Documentation

8.307.2.1 template<class ResSigT, class ImgSigT> HxImgFtorNgb2d< ResSigT, ImgSigT, HxNgbMean<typename ResSigT::ArithType, typename ImgSigT::ArithType> > HxInstNgb2dMean::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxNgbMeanInst.c

8.308 HxInstNgbIsMaxGradDir2d Class Template Reference

Instantiator for neighbourhood operation with non maximum suppression based on maximum detection.

Public Attributes

- **HxImgFtorNgb2d**< DstSigT, SrcSigT, **HxNgbIsMaxGradDir2d**< typename DstSigT::ArithType, typename SrcSigT::ArithType > > **f**
  Instantiate image functor.

8.308.1 Detailed Description

template<class DstSigT, class SrcSigT> class HxInstNgbIsMaxGradDir2d< DstSigT, SrcSigT >

Instantiator for neighbourhood operation with non maximum suppression based on maximum detection.

8.308.2 Member Data Documentation

8.308.2.1 template<class DstSigT, class SrcSigT> HxImgFtorNgb2d< DstSigT, SrcSigT, HxNgbIsMaxGradDir2d<typename DstSigT::ArithType, typename SrcSigT::ArithType> > HxInstNgbIsMaxGradDir2d::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxNgbIsMaxGradDir2dInst.c

8.309 HxInstNgbLWshed2d Struct Template Reference

Instantiator for neighbourhood operation with LWshed.

Public Attributes

- **HxImgFtorNgb2d**< ImgSigT, ImgSigT, **HxNgbLWshed2d**< typename ImgSigT::ArithType, typename ImgSigT::ArithType > > **f**

Instantiate image functor.

8.309.1 Detailed Description

template<class ImgSigT> struct HxInstNgbLWshed2d< ImgSigT >

Instantiator for neighbourhood operation with LWshed.

8.309.2 Member Data Documentation

8.309.2.1 template<class ImgSigT> HxImgFtorNgb2d< ImgSigT, ImgSigT, HxNgbLWshed2d<typename ImgSigT::ArithType, typename ImgSigT::ArithType > > HxInstNgbLWshed2d::f

Instantiate image functor.

The documentation for this struct was generated from the following file:

- HxNgbLWshed2dInst.c

8.310 HxInstNgbNonMaxSuppression2d Class Template Reference

Instantiator for neighbourhood operation with non maximum suppression.

Public Attributes

- **HxImgFtorNgb2d**< ImgSigT, ImgSigT, **HxNgbNonMaxSuppression2d**< typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.310.1 Detailed Description

template<class ImgSigT> class HxInstNgbNonMaxSuppression2d< ImgSigT >

Instantiator for neighbourhood operation with non maximum suppression.

8.310.2 Member Data Documentation

8.310.2.1 template<class ImgSigT> HxImgFtorNgb2d< ImgSigT, ImgSigT, HxNgbNonMaxSuppression2d<typename ImgSigT::ArithType> > HxInstNgbNonMaxSuppression2d::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxNgbNonMaxSuppression2dInst.c

8.311 HxInstNgbPercentile2d Class Template Reference

Instantiator for neighbourhood operation with percentile.

Public Attributes

- **HxImgFtorNgb2d**< ImgSigT, ImgSigT, **HxNgbPercentile2d**< typename ImgSigT::ArithType > > **f**

  Instantiate image functor.

8.311.1 Detailed Description

template<**class ImgSigT**> **class HxInstNgbPercentile2d**< **ImgSigT** >

Instantiator for neighbourhood operation with percentile.

8.311.2 Member Data Documentation

8.311.2.1 template<class ImgSigT> HxImgFtorNgb2d< ImgSigT, ImgSigT, HxNgbPercentile2d<typename ImgSigT::ArithType> > HxInstNgbPercentile2d::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxNgbPercentile2dInst.c

8.312 HxInstRecGenConv2dAddMin Class Template Reference

Instantiator for recursive generalized convolution operation on 2d images with addition and minimum as basic operations.

Public Attributes

- **HxImgFtorRecGenConv2d**< ImgSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoMinAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.312.1 Detailed Description

template<**class ImgSigT, class KerSigT**> **class HxInstRecGenConv2dAddMin**< **ImgSigT, KerSigT** >

Instantiator for recursive generalized convolution operation on 2d images with addition and minimum as basic operations.

8.312.2 Member Data Documentation

8.312.2.1 template<class ImgSigT, class KerSigT> HxImgFtorRecGenConv2d< ImgSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoMinAssign<typename KerSigT::ArithType, typename KerSigT::ArithType> > HxInstRecGenConv2dAddMin::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRecGenConvAddMinInst.c

8.313 HxInstRecGenConv2dK1dAddMin Class Template Reference

Instantiator for recursive generalized convolution operation on 2d images with addition and minimum as basic operations.

Public Attributes

- **HxImgFtorRecGenConv2dK1d**< ImgSigT, KerSigT, **HxBpoAdd**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoMinAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.313.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstRecGenConv2dK1dAddMin< ImgSigT, KerSigT >

Instantiator for recursive generalized convolution operation on 2d images with addition and minimum as basic operations.

8.313.2 Member Data Documentation

8.313.2.1 template<class ImgSigT, class KerSigT> HxImgFtorRecGenConv2dK1d< ImgSigT, KerSigT, HxBpoAdd<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoMinAssign<typename KerSigT::ArithType, typename KerSigT::ArithType> > HxInstRecGenConv2dK1dAddMin::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRecGenConvAddMinInst.c

8.314 HxInstRecGenConv2dK1dMulAdd Class Template Reference

Instantiator for recursive generalized convolution operation on 2d images with multiplication and addition as basic operations.

Public Attributes

- **HxImgFtorRecGenConv2dK1d**< ImgSigT, KerSigT, **HxBpoMul**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoAddAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.314.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstRecGenConv2dK1dMulAdd< ImgSigT, KerSigT >

Instantiator for recursive generalized convolution operation on 2d images with multiplication and addition as basic operations.

8.314.2 Member Data Documentation

8.314.2.1 template<class ImgSigT, class KerSigT> HxImgFtorRecGenConv2dK1d< ImgSigT, KerSigT, HxBpoMul<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoAddAssign<typename KerSigT::ArithType, typename KerSigT::ArithType> > HxInstRecGenConv2dK1dMulAdd::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRecGenConvMulAddInst.c

8.315 HxInstRecGenConv2dMulAdd Class Template Reference

Instantiator for recursive generalized convolution operation on 2d images with multiplication and addition as basic operations.

Public Attributes

- **HxImgFtorRecGenConv2d**< ImgSigT, KerSigT, **HxBpoMul**< typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType >, **HxBpoAddAssign**< typename KerSigT::ArithType, typename KerSigT::ArithType > > **f**

  Instantiate image functor.

8.315.1 Detailed Description

template<class ImgSigT, class KerSigT> class HxInstRecGenConv2dMulAdd< ImgSigT, KerSigT >

Instantiator for recursive generalized convolution operation on 2d images with multiplication and addition as basic operations.

8.315.2 Member Data Documentation

8.315.2.1 template<class ImgSigT, class KerSigT> HxImgFtorRecGenConv2d< ImgSigT, KerSigT, HxBpoMul<typename KerSigT::ArithType, typename KerSigT::ArithType, typename KerSigT::ArithType>, HxBpoAddAssign<typename KerSigT::ArithType, typename KerSigT::ArithType> > HxInstRecGenConv2dMulAdd::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRecGenConvMulAddInst.c

8.316 HxInstRgb2dBinary Class Template Reference

Instantiator for rgb operation on 2d images using binary display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbBinary**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.316.1 Detailed Description

template<class ImgSigT> class HxInstRgb2dBinary< ImgSigT >

Instantiator for rgb operation on 2d images using binary display mapping.

8.316.2 Member Data Documentation

8.316.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbBinary<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dBinary::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbBinaryInst.c

8.317 HxInstRgb2dCMY Class Template Reference

Instantiator for rgb operation on 2d images using CMY display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbCMY**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.317.1 Detailed Description

template<**class ImgSigT**> **class HxInstRgb2dCMY**< **ImgSigT** >

Instantiator for rgb operation on 2d images using CMY display mapping.

8.317.2 Member Data Documentation

8.317.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbCMY<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dCMY::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbCMYInst.c

8.318 HxInstRgb2dDirect Class Template Reference

Instantiator for rgb operation on 2d images using direct display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbDirect**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.318.1 Detailed Description

template<**class ImgSigT**> **class HxInstRgb2dDirect**< **ImgSigT** >

Instantiator for rgb operation on 2d images using direct display mapping.

8.318.2 Member Data Documentation

8.318.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbDirect<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dDirect::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbDirectInst.c

8.319 HxInstRgb2dDirectNC Class Template Reference

Instantiator for rgb operation on 2d images using direct display mapping without clipping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbDirectNC**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.319.1 Detailed Description

template<class ImgSigT> class HxInstRgb2dDirectNC< ImgSigT >

Instantiator for rgb operation on 2d images using direct display mapping without clipping.

8.319.2 Member Data Documentation

8.319.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbDirectNC<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dDirectNC::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbDirectInst.c

8.320 HxInstRgb2dHSI Class Template Reference

Instantiator for rgb operation on 2d images using HSI display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbHSI**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

Instantiate image functor.

8.320.1 Detailed Description

template<class ImgSigT> class HxInstRgb2dHSI< ImgSigT >

Instantiator for rgb operation on 2d images using HSI display mapping.

8.320.2 Member Data Documentation

8.320.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbHSI<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dHSI::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbHSIInst.c

8.321 HxInstRgb2dLab Class Template Reference

Instantiator for rgb operation on 2d images using Lab display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbLab**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.321.1 Detailed Description

template<class ImgSigT> class HxInstRgb2dLab< ImgSigT >

Instantiator for rgb operation on 2d images using Lab display mapping.

8.321.2 Member Data Documentation

8.321.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbLab<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dLab::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbLabInst.c

8.322 HxInstRgb2dLabel Class Template Reference

Instantiator for rgb operation on 2d images using label display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbLabel**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.322.1 Detailed Description

template<**class ImgSigT**> **class HxInstRgb2dLabel**< **ImgSigT** >

Instantiator for rgb operation on 2d images using label display mapping.

8.322.2 Member Data Documentation

8.322.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbLabel<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dLabel::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbLabelInst.c

8.323 HxInstRgb2dLogMag Class Template Reference

Instantiator for rgb operation on 2d images using log magnitude display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbLogMag**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.323.1 Detailed Description

template<**class ImgSigT**> **class HxInstRgb2dLogMag**< **ImgSigT** >

Instantiator for rgb operation on 2d images using log magnitude display mapping.

8.323.2 Member Data Documentation

8.323.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbLogMag<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dLogMag::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbLogMagInst.c

8.324 HxInstRgb2dLuv Class Template Reference

Instantiator for rgb operation on 2d images using Luv display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbLuv**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.324.1 Detailed Description

template<class ImgSigT> class HxInstRgb2dLuv< ImgSigT >

Instantiator for rgb operation on 2d images using Luv display mapping.

8.324.2 Member Data Documentation

8.324.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbLuv<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dLuv::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbLuvInst.c

8.325 HxInstRgb2dOOO Class Template Reference

Instantiator for rgb operation on 2d images using OOO display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbOOO**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

Instantiate image functor.

8.325.1 Detailed Description

template<class ImgSigT> class HxInstRgb2dOOO< ImgSigT >

Instantiator for rgb operation on 2d images using OOO display mapping.

8.325.2 Member Data Documentation

8.325.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbOOO<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dOOO::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbOOOInst.c

8.326 HxInstRgb2dStretch Class Template Reference

Instantiator for rgb operation on 2d images using stretched display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbStretch**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.326.1 Detailed Description

template<class ImgSigT> class HxInstRgb2dStretch< ImgSigT >

Instantiator for rgb operation on 2d images using stretched display mapping.

8.326.2 Member Data Documentation

8.326.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbStretch<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dStretch::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbStretchInst.c

8.327 HxInstRgb2dXYZ Class Template Reference

Instantiator for rgb operation on 2d images using XYZ display mapping.

Public Attributes

- **HxImgFtorRgb2d**< ImgSigT, **HxRgbXYZ**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.327.1 Detailed Description

template<class ImgSigT> class HxInstRgb2dXYZ< ImgSigT >

Instantiator for rgb operation on 2d images using XYZ display mapping.

8.327.2 Member Data Documentation

8.327.2.1 template<class ImgSigT> HxImgFtorRgb2d< ImgSigT, HxRgbXYZ<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb2dXYZ::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbXYZInst.c

8.328 HxInstRgb3dBinary Class Template Reference

Instantiator for rgb operation on 3d images using binary display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbBinary**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.328.1 Detailed Description

template<class ImgSigT> class HxInstRgb3dBinary< ImgSigT >

Instantiator for rgb operation on 3d images using binary display mapping.

8.328.2 Member Data Documentation

8.328.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbBinary<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dBinary::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbBinaryInst.c

8.329 HxInstRgb3dCMY Class Template Reference

Instantiator for rgb operation on 3d images using CMY display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbCMY**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**
  Instantiate image functor.

8.329.1 Detailed Description

template<class ImgSigT> class HxInstRgb3dCMY< ImgSigT >

Instantiator for rgb operation on 3d images using CMY display mapping.

8.329.2 Member Data Documentation

8.329.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbCMY<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dCMY::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbCMYInst.c

8.330 HxInstRgb3dDirect Class Template Reference

Instantiator for rgb operation on 3d images using direct display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbDirect**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

Instantiate image functor.

8.330.1 Detailed Description

template<class ImgSigT> class HxInstRgb3dDirect< ImgSigT >

Instantiator for rgb operation on 3d images using direct display mapping.

8.330.2 Member Data Documentation

8.330.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbDirect<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dDirect::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbDirectInst.c

8.331 HxInstRgb3dHSI Class Template Reference

Instantiator for rgb operation on 3d images using HSI display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbHSI**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.331.1 Detailed Description

template<class ImgSigT> class HxInstRgb3dHSI< ImgSigT >

Instantiator for rgb operation on 3d images using HSI display mapping.

8.331.2 Member Data Documentation

8.331.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbHSI<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dHSI::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbHSIInst.c

8.332 HxInstRgb3dLab Class Template Reference

Instantiator for rgb operation on 3d images using Lab display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbLab**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.332.1 Detailed Description

template<**class ImgSigT**> **class HxInstRgb3dLab**< **ImgSigT** >

Instantiator for rgb operation on 3d images using Lab display mapping.

8.332.2 Member Data Documentation

8.332.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbLab<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dLab::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbLabInst.c

8.333 HxInstRgb3dLabel Class Template Reference

Instantiator for rgb operation on 3d images using label display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbLabel**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.333.1 Detailed Description

template<**class ImgSigT**> **class HxInstRgb3dLabel**< **ImgSigT** >

Instantiator for rgb operation on 3d images using label display mapping.

8.333.2 Member Data Documentation

8.333.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbLabel<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dLabel::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbLabelInst.c

8.334 HxInstRgb3dLogMag Class Template Reference

Instantiator for rgb operation on 3d images using log magnitude display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbLogMag**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**
  Instantiate image functor.

8.334.1 Detailed Description

template<class ImgSigT> class HxInstRgb3dLogMag< ImgSigT >

Instantiator for rgb operation on 3d images using log magnitude display mapping.

8.334.2 Member Data Documentation

8.334.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbLogMag<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dLogMag::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbLogMagInst.c

8.335 HxInstRgb3dLuv Class Template Reference

Instantiator for rgb operation on 3d images using Luv display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbLuv**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

Instantiate image functor.

8.335.1 Detailed Description

template<class ImgSigT> class HxInstRgb3dLuv< ImgSigT >

Instantiator for rgb operation on 3d images using Luv display mapping.

8.335.2 Member Data Documentation

8.335.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbLuv<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dLuv::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbLuvInst.c

8.336 HxInstRgb3dOOO Class Template Reference

Instantiator for rgb operation on 3d images using OOO display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbOOO**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.336.1 Detailed Description

template<class ImgSigT> class HxInstRgb3dOOO< ImgSigT >

Instantiator for rgb operation on 3d images using OOO display mapping.

8.336.2 Member Data Documentation

8.336.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbOOO<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dOOO::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbOOOInst.c

8.337 HxInstRgb3dStretch Class Template Reference

Instantiator for rgb operation on 3d images using stretched display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbStretch**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.337.1 Detailed Description

template<**class ImgSigT**> **class HxInstRgb3dStretch**< **ImgSigT** >

Instantiator for rgb operation on 3d images using stretched display mapping.

8.337.2 Member Data Documentation

8.337.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbStretch<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dStretch::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbStretchInst.c

8.338 HxInstRgb3dXYZ Class Template Reference

Instantiator for rgb operation on 3d images using XYZ display mapping.

Public Attributes

- **HxImgFtorRgb3d**< ImgSigT, **HxRgbXYZ**< TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble > > **f**

  Instantiate image functor.

8.338.1 Detailed Description

template<**class ImgSigT**> **class HxInstRgb3dXYZ**< **ImgSigT** >

Instantiator for rgb operation on 3d images using XYZ display mapping.

8.338.2 Member Data Documentation

8.338.2.1 template<class ImgSigT> HxImgFtorRgb3d< ImgSigT, HxRgbXYZ<TYPENAME ImgSigT::ArithType, TYPENAME ImgSigT::ArithTypeDouble> > HxInstRgb3dXYZ::f

Instantiate image functor.

The documentation for this class was generated from the following file:

- HxRgbXYZInst.c

8.339 HxKernel1d Class Template Reference

Standard 1d kernel definition.

`#include <HxKernel.h>`

Public Types

- typedef ArithT **ArithType**

Public Methods

- **HxKernel1d** (KerDataPtrT kerPtr, **HxSizes** size, **HxTagList** &)
- ~**HxKernel1d** ()
- **HxSizes sizes** () const
- const ArithT & **operator()** (int i) const

Static Public Methods

- **HxString className** ()

8.339.1 Detailed Description

template<class KerDataPtrT, class ArithT> class HxKernel1d< KerDataPtrT, ArithT >

Standard 1d kernel definition.

The documentation for this class was generated from the following files:

- **HxKernel.h**
- HxKernel.c

8.340 HxKernel2d Class Template Reference

Standard 2d kernel definition.

`#include <HxKernel.h>`

Public Types

- typedef ArithT **ArithType**

Public Methods

- **HxKernel2d** (KerDataPtrT kerPtr, **HxSizes** size, **HxTagList** &)
- ~**HxKernel2d** ()
- **HxSizes sizes** () const
- ArithT **operator()** (int i, int j) const

Static Public Methods

- **HxString className** ()

8.340.1 Detailed Description

template<class KerDataPtrT, class ArithT> class HxKernel2d< KerDataPtrT, ArithT >

Standard 2d kernel definition.

The documentation for this class was generated from the following files:

- **HxKernel.h**
- HxKernel.c

8.341 HxKernel3d Class Template Reference

Standard 3d kernel definition.

`#include <HxKernel.h>`

Public Types

- typedef ArithT **ArithType**

Public Methods

- **HxKernel3d** (KerDataPtrT kerPtr, **HxSizes** size, **HxTagList** &)
- ~**HxKernel3d** ()
- **HxSizes sizes** () const
- ArithT **operator()** (int i, int j, int k) const

Static Public Methods

- **HxString className** ()

8.341.1 Detailed Description

template<class KerDataPtrT, class ArithT> class HxKernel3d< KerDataPtrT, ArithT >

Standard 3d kernel definition.

The documentation for this class was generated from the following files:

- **HxKernel.h**
- HxKernel.c

8.342 HxKerNgbNormCorrelation Class Template Reference

Neighbourhood functor for normalized (cross) correlation filter.

`#include <HxKerNgbNormCorrelation.h>`

Public Types

- typedef **HxTagLoop IteratorCategory**
  Loop version.
- typedef **HxTag2Phase PhaseCategory**
  2 phases.

Public Methods

- **HxKerNgbNormCorrelation** (**HxTagList** &tags)
  Constructor.
- ~**HxKerNgbNormCorrelation** ()
  Destructor.
- **HxSizes size** ()
  Size of the neighbourhood.
- void **init** (int ix, int iy, ArithT imVal)
  Initialization first phase.
- void **next** (int x, int y, ArithT pixV, ArithT maskV)
  Processing one pixel in first phase.
- void **init2** (int ix, int iy, ArithT imVal)
  Initialization second phase.
- void **next2** (int x, int y, ArithT pixV, ArithT maskV)
  Processing one pixel in second phase.

- ResultT **result** ()

  Produce the result value.

Static Public Methods

- **HxString className** ()

  The name : "normalizedCorrelation".

8.342.1 Detailed Description

template<class ArithT, class ResultT> class HxKerNgbNormCorrelation< ArithT, ResultT >

Neighbourhood functor for normalized (cross) correlation filter.

Formula:

\begin{verbatim} Sum[f(x,y) - fBar(x,y)][w(x,y) - wBar] x,y ———————————————————————————— Sqrt[Sum[f(x,y) - fBar(x,y)]^2 ∗ Sum[w(x,y) - wBar]^2] x,y x,y \end{verbatim}

8.342.2 Member Typedef Documentation

8.342.2.1 template<class ArithT, class ResultT> typedef HxTagLoop HxKerNgbNormCorrelation::IteratorCategory

Loop version.

8.342.2.2 template<class ArithT, class ResultT> typedef HxTag2Phase HxKerNgbNormCorrelation::PhaseCategory

2 phases.

8.342.3 Constructor & Destructor Documentation

8.342.3.1 template<class ArithT, class ResultT> HxKerNgbNormCorrelation< ArithT, ResultT >::HxKerNgbNormCorrelation (HxTagList & *tags*)

Constructor.

```
19 {
20     _ngbSize = HxGetTag(tags, "kernelSize", HxSizes(0, 0, 0));
21 }
```

8.342.3.2 template<class ArithT, class ResultT> HxKerNgbNormCorrelation< ArithT, ResultT >::∼HxKerNgbNormCorrelation ()

Destructor.

```
25 {
26 }
```

8.342.4 Member Function Documentation

8.342.4.1 template<class ArithT, class ResultT> HxSizes HxKerNgbNormCorrelation< ArithT, ResultT >::size ()

Size of the neighbourhood.

```
39 {
40     return _ngbSize;
41 }
```

8.342.4.2 template<class ArithT, class ResultT> void HxKerNgbNormCorrelation< ArithT, ResultT >::init (int *ix*, int *iy*, ArithT *imVal*) [inline]

Initialization first phase.

```
47 {
48     _num = 0;
49     _fBar = HxScalarDouble(0);
50     _wBar = HxScalarDouble(0);
51 }
```

8.342.4.3 template<class ArithT, class ResultT> void HxKerNgbNormCorrelation< ArithT, ResultT >::next (int *x*, int *y*, ArithT *pixV*, ArithT *maskV*) [inline]

Processing one pixel in first phase.

```
57 {
58     _num += 1;
59     _fBar += pixV;
60     _wBar += maskV;
61 }
```

8.342.4.4 template<class ArithT, class ResultT> void HxKerNgbNormCorrelation< ArithT, ResultT >::init2 (int *ix*, int *iy*, ArithT *imVal*) [inline]

Initialization second phase.

```
66 {
67     _fBar = _fBar / (ResultT) _num;
68     _wBar = _wBar / (ResultT) _num;
69     _sumFW = HxScalarDouble(0);
70     _sumFSqr = HxScalarDouble(0);
71     _sumWSqr = HxScalarDouble(0);
72 }
```

8.342.4.5 template<class ArithT, class ResultT> void HxKerNgbNormCorrelation< ArithT, ResultT >::next2 (int *x*, int *y*, ArithT *pixV*, ArithT *maskV*) [inline]

Processing one pixel in second phase.

```
77 {
78     ResultT p = pixV, m = maskV;
79     _sumFW += (p - _fBar) * (m - _wBar);
80     _sumFSqr += (p - _fBar) * (p - _fBar);
81     _sumWSqr += (m - _wBar) * (m - _wBar);
82 }
```

8.342.4.6 template<class ArithT, class ResultT> ResultT HxKerNgbNormCorrelation< ArithT, ResultT >::result () [inline]

Produce the result value.

```
87 {
88     ResultT tmp = _sumFSqr * _sumWSqr;
89     tmp = tmp.sqrt();
90     if (HxScalarInt(tmp) == HxScalarInt(0))
91         return ResultT(HxScalarInt(0));
92     return _sumFW / tmp;
93 }
```

8.342.4.7 template<class ArithT, class ResultT> HxString HxKerNgbNormCorrelation< ArithT, ResultT >::className () [static]

The name : "normalizedCorrelation".

```
31 {
32     static HxString name("normalizedCorrelation");
33     return name;
34 }
```

The documentation for this class was generated from the following files:

- **HxKerNgbNormCorrelation.h**
- HxKerNgbNormCorrelation.c

8.343 HxLocalInterpol Class Reference

Class definition of a functor that interpolates data points to compute knots and control points for a cubic BSpline.

`#include <HxLocalInterpol.h>`

Public Methods

- **HxLocalInterpol** ()

  Default ctor: consistent but useless object.

- **HxLocalInterpol** (int degree, const HxPointSetR2 &inputData, int closed=0)

  Create and initialize functor with given data points and curve type.

- ~**HxLocalInterpol** ()

  Destructor.

- HxPointSetR2 **allP** () const

  Get all generated control points.

- int **numP** () const

  The number of control points.

- vector< double > **allKnots** () const

  Get generated knots vector.

- int **numKnots** () const

  The number of knots.

- STD_OSTREAM & **dump** (ostream &) const

8.343.1 Detailed Description

Class definition of a functor that interpolates data points to compute knots and control points for a cubic BSpline.

Based on section 9.3.4 of "The NURBS book", "PIEGL, L. and TILLER, W.", Springer, 1997.

This could be used as a **HxBSplineCurve** (p. 477) constructor, but that would require a more general version.

8.343.2 Constructor & Destructor Documentation

8.343.2.1 HxLocalInterpol::HxLocalInterpol ()

Default ctor: consistent but useless object.

```
19 {
20     makeDefault();
21 }
```

8.343.2.2 HxLocalInterpol::HxLocalInterpol (int *degree*, const HxPointSetR2 & *p*, int *closed* = 0)

Create and initialize functor with given data points and curve type.

```
25 {
26     if ( degree != 3 ) {
27         message("(constructor) not cubic - setting degree=3");
28         degree =3;
29     }
30
31     if ( p.size() <= 0 ) {
32         message("(constructor) no data points - making default");
33         makeDefault();
34         return;
35     }
```

```
36
37     _degree = degree;
38     _data = p;
39     _closed = closed;
40
41     _n = _data.size() -1;
42     if ( _closed )
43         _initClosed();
44     else
45         _initOpen();
46 }
```

8.343.2.3 HxLocalInterpol::~HxLocalInterpol ()

Destructor.

```
49 {
50 }
```

8.343.3 Member Function Documentation

8.343.3.1 HxPointSetR2 HxLocalInterpol::allP () const [inline]

Get all generated control points.

```
99 {
100     return _points;
101 }
```

8.343.3.2 int HxLocalInterpol::numP () const [inline]

The number of control points.

```
105 {
106     return _points.size();
107 }
```

8.343.3.3 vector< double > HxLocalInterpol::allKnots () const [inline]

Get generated knots vector.

```
111 {
112     return _knots;
113 }
```

8.343.3.4 int HxLocalInterpol::numKnots () const [inline]

The number of knots.

```
117 {
118     return _knots.size();
119 }
```

The documentation for this class was generated from the following files:

- **HxLocalInterpol.h**
- HxLocalInterpol.c

8.344 HxMatrix Class Reference

Class definition for matrices.

`#include <HxMatrix.h>`

Constructors

- **HxMatrix** ()

  Empty matrix.

- **HxMatrix** (int nrow, int ncol)

  Empty matrix with given number of rows and columns.

- **HxMatrix** (int nrow, int ncol, double a)

  Matrix with constant value.

- **HxMatrix** (int nrow, int ncol, double ∗data)

  Matrix with given data.

- **HxMatrix** (const HxMatrix &m)

  Copy constructor.

- **HxMatrix** (const **HxVector** &v)

  Copy from vector constructor.

- **HxMatrix** (const **HxVector** &v1, const **HxVector** &v2)

  Copy from 2 vectors constructor.

- **HxMatrix** (const **HxVector** &v1, const **HxVector** &v2, const **HxVector** &v3)

  Copy from 3 vectors constructor.

- **HxMatrix** (const **HxVector** &v1, const **HxVector** &v2, const **HxVector** &v3, const **HxVector** &v4)

  Copy from 4 vectors constructor.

- **HxMatrix** (const **HxVector** &v1, const **HxVector** &v2, const **HxVector** &v3, const **HxVector** &v4, const **HxVector** &v5)

  Copy from 5 vectors constructor.

- **HxMatrix** (const **HxVector** &v1, const **HxVector** &v2, const **HxVector** &v3, const **HxVector** &v4, const **HxVector** &v5, const **HxVector** &v6)

  Copy from 6 vectors constructor.

Inquiry

- int **nRow** () const

  Number of rows.

- int **nCol** () const

  Number of columns.

- int **nElem** () const

  Number of elements.

- int **valid** () const

  Indicates whether the matrix is valid.

Operators

- HxMatrix & **operator=** (double a)

  Assign constant value.

- HxMatrix & **operator=** (const HxMatrix &m)

  Normal assigment.

- double * **operator[ ]** (int i) const

  Subscripting, start with 0.

- HxMatrix **operator-** () const

  Unary minus.

- HxMatrix **operator** * (const HxMatrix &a, double b)

  Multiplication.

- HxMatrix **operator** * (double a, const HxMatrix &b)

  Multiplication.

- HxMatrix **operator** * (const HxMatrix &a, const HxMatrix &b)

  Multiplication.

- **HxVector operator** * (const **HxVector** &a, const HxMatrix &b)

  Multiplication.

- **HxVector operator** * (const HxMatrix &a, const **HxVector** &b)

  Multiplication.

- HxMatrix **operator/** (const HxMatrix &a, double b)
  Division.
- HxMatrix **operator/** (double a, const HxMatrix &b)
  Division.
- HxMatrix **operator+** (const HxMatrix &a, const HxMatrix &b)
  Addition.
- HxMatrix **operator+** (const HxMatrix &a, double b)
  Addition.
- HxMatrix **operator+** (double a, const HxMatrix &b)
  Addition.
- HxMatrix **operator-** (const HxMatrix &a, const HxMatrix &b)
  Subtraction.
- HxMatrix **operator-** (const HxMatrix &a, double b)
  Subtraction.
- HxMatrix **operator-** (double a, const HxMatrix &b)
  Subtraction.
- int **operator==** (const HxMatrix &a, const HxMatrix &b)
  Equal.
- int **operator!=** (const HxMatrix &a, const HxMatrix &b)
  Not equal.
- **HxVec3Double operator** ∗ (const **HxVec3Double** &a, const HxMatrix &b)
  Multiplication.
- **HxVec3Double operator** ∗ (const HxMatrix &a, const **HxVec3Double** &b)
  Multiplication.

Operations

- HxMatrix **i** () const
  Inverse.
- HxMatrix **t** () const
  Transpose.
- HxMatrix **svd** (**HxVector** &W, HxMatrix &V) const
  Singular Value Decomposition.
- HxMatrix **add** (const HxMatrix &b) const

Addition.

- HxMatrix **add** (const double val) const
  Addition.
- HxMatrix **sub** (const HxMatrix &b) const
  Subtraction.
- HxMatrix **sub** (const double val) const
  Subtraction.
- HxMatrix **mul** (const HxMatrix &b) const
  Multiplication.
- HxMatrix **mul** (const **HxVector** &v) const
  Multiplication.
- HxMatrix **mul** (const double val) const
  Multiplication.
- HxMatrix **div** (const double val) const
  Division.
- HxMatrix **sin** () const
  Apply sin to each element.
- HxMatrix **cos** () const
  Apply cos to each element.
- HxMatrix **tan** () const
  Apply tan to each element.
- HxMatrix **sinh** () const
  Apply sinh to each element.
- HxMatrix **cosh** () const
  Apply cosh to each element.
- HxMatrix **tanh** () const
  Apply tanh to each element.
- HxMatrix **exp** () const
  Apply exp to each element.
- HxMatrix **log** () const
  Apply log to each element.
- HxMatrix **sqrt** () const
  Apply sqrt to each element.

- HxMatrix **abs** () const
  Apply abs to each element.
- HxMatrix **sgn** () const
  Apply sgn to each element.
- HxMatrix **map** (double(∗f)(double)) const
  Map f to each element of this.

Matrix generation

Generate coordinate transformation matrices for postfix vector multiplication

- HxMatrix **translate2d** (double x, double y)
  Translation in 2D.
- HxMatrix **scale2d** (double sx, double sy)
  Scaling in 2D.
- HxMatrix **rotate2d** (double alpha)
  Rotation in 2D (alpha in rad).
- HxMatrix **rotate2dDeg** (double alpha)
  Rotation in 2D (alpha in deg).
- HxMatrix **reflect2d** (int doX, int doY)
  Reflection in 2D (if (doX != 0) reflect X), etc.
- HxMatrix **shear2d** (double sx, double sy)
  Shearing in 2D.
- HxMatrix **translate3d** (double x, double y, double z)
  Translation in 3D.
- HxMatrix **scale3d** (double sx, double sy, double sz)
  Scaling in 3D.
- HxMatrix **rotateX3d** (double alpha)
  Rotation around X-axis in 3D (alpha in rad).
- HxMatrix **rotateX3dDeg** (double alpha)
  Rotation around X-axis in 3D (alpha in deg).
- HxMatrix **rotateY3d** (double alpha)
  Rotation around Y-axis in 3D (alpha in rad).
- HxMatrix **rotateY3dDeg** (double alpha)
  Rotation around Y-axis in 3D (alpha in deg).

- HxMatrix **rotateZ3d** (double alpha)

  Rotation around Z-axis in 3D (alpha in rad).

- HxMatrix **rotateZ3dDeg** (double alpha)

  Rotation around Z-axis in 3D (alpha in deg).

- HxMatrix **reflect3d** (int doX, int doY, int doZ)

  Reflection in 3D (if (doX != 0) reflect X), etc.

- HxMatrix **projection** (double f)

  Projection matrix.

- HxMatrix **camera** (double f)

  Camera transformation.

- HxMatrix **lift2dTo3dXY** ()

  Lift 2D plane to 3D XY-plane.

8.344.1 Detailed Description

Class definition for matrices.

The dimensions are of arbitrary size.

8.344.2 Constructor & Destructor Documentation

8.344.2.1 HxMatrix::HxMatrix () [inline]

Empty matrix.

```
323 {
324     _nr = 0;
325     _nc = 0;
326     _data = 0;
327 }
```

8.344.2.2 HxMatrix::HxMatrix (int *nRow*, int *nCol*) [inline]

Empty matrix with given number of rows and columns.

```
331 {
332     _nr = nRow;
333     _nc = nCol;
334     _data = new double[_nr * _nc];
335 }
```

8.344.2.3 HxMatrix::HxMatrix (int *nRow*, int *nCol*, double *a*) [inline]

Matrix with constant value.

```
339 {
340     _nr = nRow;
341     _nc = nCol;
342     _data = new double[_nr * _nc];
343 
344     double* t = _data;
345     int i = nElem();
346     while (--i >= 0)
347         *t++ = a;
348 }
```

8.344.2.4 HxMatrix::HxMatrix (int *nRow*, int *nCol*, double * *data*) [inline]

Matrix with given data.

```
352 {
353     _nr = nRow;
354     _nc = nCol;
355     _data = data;
356 }
```

8.344.2.5 HxMatrix::HxMatrix (const HxMatrix & *m*) [inline]

Copy constructor.

```
359 {
360     _nr = m.nRow();
361     _nc = m.nCol();
362     _data = new double[_nr * _nc];
363 
364     double* t = m._data;
365     double* u = _data;
366     int i = m.nElem();
367     while (--i >= 0)
368         *u++ = *t++;
369 }
```

8.344.2.6 HxMatrix::HxMatrix (const HxVector & *v*)

Copy from vector constructor.

```
35 {
36     _nc = v.nElem();
37     _nr = 1;
38     _data = new double[_nr * _nc];
39 
40     double* t = v._data;
41     double* u = _data;
42     int i = v.nElem();
43     while (--i >= 0)
44         *u++ = *t++;
45 }
```

8.344.2.7 HxMatrix::HxMatrix (const HxVector & *v1*, const HxVector & *v2*)

Copy from 2 vectors constructor.

```
48 {
49     if (v1.nElem() != v2.nElem()) {
50         error("differently sized input vectors for matrix construction.");
51         _nr = 0; _nc = 0; _data = 0;
52         return;
53     }
54     _nc = v1.nElem();
55     _nr = 2;
56     _data = new double[_nr * _nc];
57 
58     double* t = v1._data;
59     double* u = _data;
60     int i = v1.nElem();
61     while (--i >= 0)
62         *u++ = *t++;
63 
64     i = v2.nElem();
65     t = v2._data;
66     while (--i >= 0)
67         *u++ = *t++;
68 }
```

8.344.2.8 HxMatrix::HxMatrix (const HxVector & *v1*, const HxVector & *v2*, const HxVector & *v3*)

Copy from 3 vectors constructor.

```
71 {
72     if ((v1.nElem() != v2.nElem()) || (v1.nElem() != v3.nElem())) {
73         error("differently sized input vectors for matrix construction.");
74         _nr = 0; _nc = 0; _data = 0;
75         return;
76     }
77     _nc = v1.nElem();
78     _nr = 3;
79     _data = new double[_nr * _nc];
80 
81     double* t = v1._data;
82     double* u = _data;
```

```
83      int i = v1.nElem();
84      while (--i >= 0)
85          *u++ = *t++;
86
87      i = v2.nElem();
88      t = v2._data;
89      while (--i >= 0)
90          *u++ = *t++;
91
92      i = v3.nElem();
93      t = v3._data;
94      while (--i >= 0)
95          *u++ = *t++;
96  }
```

8.344.2.9 HxMatrix::HxMatrix (const HxVector & *v1*, const HxVector & *v2*, const HxVector & *v3*, const HxVector & *v4*)

Copy from 4 vectors constructor.

```
100 {
101     if ((v1.nElem() != v2.nElem()) || (v1.nElem() != v3.nElem()) ||
102         (v1.nElem() != v4.nElem())) {
103         error("differently sized input vectors for matrix construction.");

8.345 HxMfBpo Class Reference

Class definition of method frame for binary pixel operations.

`#include <HxMfBpo.h>`

Public Methods

- **HxMfBpo** (**HxImageData** ∗src1, **HxImageData** ∗src2, **HxString** bpoName)

  Constructor.

- ∼**HxMfBpo** ()

  Destructor.

- **HxImageData** ∗ **source1** () const
  The first argument image of the frame.
- **HxImageData** ∗ **source2** () const
  The second argument image of the frame.
- **HxImageData** ∗ **result** () const
  The result image of the frame.
- bool **preOpIsOk** () const
  Indicates whether initialization was OK.

8.345.1 Detailed Description

Class definition of method frame for binary pixel operations.

First queries the **HxImgFtorRuleBase** (p. 840) for an exact match on

resulttype of bpo<src1,src2,bpoName>

If that is not found we look for

argumenttype of bpo<src1,bpoName>

If the argumenttype is not found or it does not match the signature of src2 we try to find

argumenttype of bpo<broadest(src1,src2),bpoName>

If that is also not found, an error is generated. Based on the argumenttype we find the resulttype with

resulttype of bpo<argumenttype,bpoName>

8.345.2 Constructor & Destructor Documentation

8.345.2.1 HxMfBpo::HxMfBpo (HxImageData ∗ *src1*, HxImageData ∗ *src2*, HxString *bpoName*)

Constructor.

  The second kernel image of the frame.

- **HxImageData** * **kernel3** () const

  The third kernel image of the frame.

- **HxImageData** * **result** () const

  The result image of the frame.

- bool **preOpIsOk** () const

  Indicates whether initialization was OK.

8.348.1 Detailed Description

Class definition of method frame for generalized convolution operations.

The method frame tries to satisfy the general rules set out for generalized convolutions. If this is not possible, preOpOk() will return false.

If is1dConv is false, the kernel should have the same dimensionality as the image, otherwise preOpOk() will return false.

If necessary the type of the kernel will be converted according to the following rules:

1) The kernel type signature must be equal or broader than the source type signature.

2a) If the kernel has an integral pixel type its pixel precision will be that of int.

2b) If the kernel has a real pixel type its pixel precision will be that of double.

The type of the result image will be set according to the specified precision:

- SOURCE_PREC The result type is the same as the source type.
- ARITH_PREC The result type is the same as the type of the kernel after the kernel has been converted.
- SMALL_PREC The result type will be the same as above but with a smaller pixel precision. If the kernel has an integral pixel type the result pixel precision is that of short. If the kernel has a real pixel type the result pixel precision is that of float.

Note that the actual convolution will be performed in the precision of the kernel type after conversion. After that, the result is written to the output image

8.348.2 Constructor & Destructor Documentation

8.349 HxMfIdentity Class Reference

Class definition of method frame for identity.

`#include <HxMfIdentity.h>`

Public Methods

- **HxMfIdentity** (**HxImageData** *src, int pixDim=0)

  Constructor.

- ~**HxMfIdentity** ()

  Destructor.

- **HxImageData** * **source** () const

  The source image of the frame.

- **HxImageData** * **result** () const

  The result image of the frame.

8.349.1 Detailed Description

Class definition of method frame for identity.

The method frame just copies the image data to ensure the value paradigm. So, **result**() (p. 1018) will point to a copy of src (with the same signature, sizes and pixel values) to take care of the value paradigm. However, if (pixDim != 0) it will have the specified pixel dimensionality.

8.349.2 Constructor & Destructor Documentation

8.349.2.1 HxMfIdentity::HxMfIdentity (HxImageData * *src*, int *pixDim* = 0)

Constructor.

```
16                                                      : _source(src)
17 {

8.352 HxMfMpo Class Reference

Class definition of method frame for multi pixel operations.

`#include <HxMfMpo.h>`

Public Methods

- **HxMfMpo** (**HxImageData** ∗∗srcs, int nSrcs, **HxString** mpoName)
  Constructor.
- ∼**HxMfMpo** ()
  Destructor.
- **HxImageData** ∗∗ **sources** () const
  The source images of the frame.
- int **nSources** () const
  The number of source images of the frame.
- **HxImageData** ∗ **result** () const
  The result image of the frame.

8.352.1 Detailed Description

Class definition of method frame for multi pixel operations.

First we determine the broadest signature and supremum of sizes of all source images. The sources images are prepared to match that signature and sizes.

A result image will be allocated with the same size as the source images. The type of the result image is obtained from the **HxImgFtorRuleBase** (p. 840) via

resulttype of mpo<broadest,mpoName>

8.352.2 Constructor & Destructor Documentation

8.355 HxMfResize Class Reference

Class definition of method frame for resizing of image.

`#include <HxMfResize.h>`

Public Methods

- **HxMfResize** (**HxImageData** *src, **HxSizes** newSize, **HxImageData** *argImg=0)

  Constructor.

- ~**HxMfResize** ()

  Destructor.

- **HxImageData** * **source** () const

  The source image of the frame.

- **HxImageData** * **argument** () const

  The argument image of the frame.

- **HxImageData** * **result** () const

  The result image of the frame.

8.355.1 Detailed Description

Class definition of method frame for resizing of image.

The method frame is used when the resulting image has a different size than the operand image.

result() (p. 1033) will point to an empty image with the signature of src and the specified sizes. In case the signature of argImg is not equal to the signature of src a temporary image with that signature will be created for **argument**() (p. 1033) with the same pixel values as argImg.

8.355.2 Constructor & Destructor Documentation

8.355.2.1 HxMfResize::HxMfResize (HxImageData * *src*, HxSizes *newSize*, HxImageData * *argImg* = 0)

8.369 HxNJet Class Reference

Class definition for NJet.

`#include <HxNJet.h>`

Public Methods

- **HxNJet** ()
  Constructor.
- **HxNJet** (**HxImageRep** im, int N, double scale, double precision=3)
  Construct an NJet from the given image at the given scale in given precision using Gaussians.
- **HxNJet** (**HxString** fileName)
  Read an NJet from file.
- **HxNJet** (const HxNJet &rhs)
  Copy constructor.
- virtual ~**HxNJet** ()
  Destructor.
- bool **toFile** (**HxString** fileName) const
  Write an NJet to file.
- HxNJet & **operator=** (const HxNJet &rhs)
  Assignment operator.
- int **ident** () const
  The identity of the NJet.
- int **order** () const
  The order N.
- double **scale** () const
  The scale.
- int **nrComponents** () const
  The number of components.
- int **isColor** () const
  Indicator whether its a color or grey value NJet.
- **HxImageRep xy** (int x, int y) const
  Get the specified 2D component.
- **HxImageRep xyz** (int x, int y, int z) const
  Get the specified 3D component.

- **HxImageRep xyl** (int x, int y, int l) const
  Get the specified 2D color component.
- **HxImageRep xyzl** (int x, int y, int z, int l) const
  Get the specified 3D color component.
- **HxImageRep getLidx** (int i) const
  Get the specified L component.
- **HxImageRep getJidx** (int i) const
  Get the specified J component.
- **HxImageRep getMidx** (int i) const
  Get the specified M component.
- **HxImageList getLList** () const
  Get all the L components.
- **HxImageList getJList** () const
  Get all the J components.
- **HxImageList getMList** () const
  Get all the M components.
- **HxImageList getList** () const
  Get all the components.
- **HxImageRep getLw** () const
  Get the L gradient magnitude.
- **HxImageRep getJw** () const
  Get the J gradient magnitude.
- **HxImageRep getMw** () const
  Get the M gradient magnitude.
- void **rotate** (double phi)
- void **rotateDeg** (double phi)
- void **rotate** (**HxImageRep** phi)
- void **resample** (double fac)
- void **truncate** (int order)
- void **normalize** ()
- STD_OSTREAM & **put** (STD_OSTREAM &os) const
  Put some information on the given stream.
- int **ord2idx** (int i, int j) const
  Translate from ord to idx.
- int **ord2idx** (int i, int j, int k) const
  Translate from ord to idx 3D (not supported yet).

8.369.1 Detailed Description

Class definition for NJet.

Generates all components up to and including the N-th order in the following sequence: For 2D images:

- order 0 : L,
- order 1 : Lx, Ly,
- order 2 : Lxx, Lxy, Lyy,
- etc.

Color images are stored in the opponent color respresentation, the L component representing luminance (the Gaussian smoothed spectral response), the J component the first order spectral derivative (yellow-blue), and the M component the second order spectral derivative (red-green). Grey images are only stored in the L component, J and M being zero.

Components L, J, and M can be specified in one of the following ways:

- xy : the indices represent the x and y derivative order. For example, xy(0,1) is Ly.
- xyz : the indices represent the x, y, and z derivative order. For example, xyz(1,1,2) is Lxyzz.
- xyl : the indices represent the x, y, and spectral (lambda) derivative order. For example, xyl(1,1,2) is Mxy.
- xyzl: the indices represent the x, y, z, and spectral (lambda) derivative order. For example, xyzl(1,1,1,1) is Jxyz.
- idx : the index is the index in the sequence in which all components are generated (and stored in the internal data structure). For example, getLidx(3) is Ly in case of 2D images. Low level function, preferably do not use.

TODO: IMPLEMENTATION FOR 3D IMAGES AND ORDERS HIGHER THAN 2.

8.369.2 Constructor & Destructor Documentation

8.369.2.1 HxNJet::HxNJet ()

Constructor.

23                                                        precision);
24 }
```

8.369.2.3 HxNJet::HxNJet (HxString *fileName*)

Read an NJet from file.

```
27 {
28     HxTagList tags;
29 
30     _pointee = HxNJetDataFactory::instance().fromFile(fileName, tags);
31     _order = HxGetTag(tags, "NJet Order", 4);
32     _scale = HxGetTag(tags, "NJet Scale", 3.0);
33 }
```

8.369.2.4 HxNJet::HxNJet (const HxNJet & *rhs*)

Copy constructor.

```
35                                  : _order(rhs._order), _scale(rhs._scale),
36                                      _pointee(rhs.pointee())
37 {
38 }
```

8.369.2.5 HxNJet::~HxNJet () [virtual]

Destructor.

```
41 {
42 }
```

8.369.3 Member Function Documentation

8.369.3.1 bool HxNJet::toFile (HxString *fileName*) const

Write an NJet to file.

```
46 {
47     HxTagList tags;
48 
49     return HxNJetDataFactory::instance().toFile(*this, fileName, tags);
50 }
```

8.369.3.2 HxNJet & HxNJet::operator= (const HxNJet & *rhs*)

Assignment operator.

```
54 {
55     _order = rhs._order;
56     _scale = rhs._scale;
57     _pointee = rhs._pointee;
58     return *this;
59 }
```

8.369.3.3 int HxNJet::ident () const

The identity of the NJet.

```
63 {
64     return pointee() ? pointee()->ident() : 0;
65 }
```

8.369.3.4 int HxNJet::order () const

The order N.

```
69 {
70     return _order;
71 }
```

8.369.3.5 double HxNJet::scale () const

The scale.

```
75 {
76     return _scale;
77 }
```

8.369.3.6 int HxNJet::nrComponents () const

The number of components.

```
81 {
82     return pointee() ? pointee()->nrComponents() : 0;
83 }
```

8.369.3.7 int HxNJet::isColor () const

Indicator whether its a color or grey value NJet.

```
87 {
88     return pointee() ? pointee()->isColor() : 0;
89 }
```

8.369.3.8 HxImageRep HxNJet::xy (int *x*, int *y*) const

Get the specified 2D component.

```
114 {
115     return getLidx(ord2idx(x, y));
116 }
```

8.369.3.9 HxImageRep HxNJet::xyz (int *x*, int *y*, int *z*) const

Get the specified 3D component.

```
120 {
121     return getLidx(ord2idx(x, y, z));
122 }
```

8.369.3.10 HxImageRep HxNJet::xyl (int *x*, int *y*, int *l*) const

Get the specified 2D color component.

```
126 {
127     switch (l) {
128     case 0:
129         return getLidx(ord2idx(x, y));
130     case 1:

132     case 2:
133         return getMidx(ord2idx(x, y));
134     }
135     return HxImageRep();
136 }
```

8.369.3.11 HxImageRep HxNJet::xyzl (int *x*, int *y*, int *z*, int *l*) const

Get the specified 3D color component.

```
140 {
141     switch (l) {
142     case 0:
143         return getLidx(ord2idx(x, y, z));
144     case 1:
145         return getJidx(ord2idx(x, y, z));
146     case 2:
147         return getMidx(ord2idx(x, y, z));
148     }
149     return HxImageRep();
150 }
```

8.369.3.12 HxImageRep HxNJet::getLidx (int *i*) const

Get the specified L component.

```
93 {
94     HxImageRep im;
95     return pointee() ? pointee()->getL(i) : im;
96 }
```

8.369.3.13 HxImageRep HxNJet::getJidx (int *i*) const

Get the specified J component.

```
100 {
101     HxImageRep im;
102     return pointee() ? pointee()->getJ(i) : im;
103 }
```

8.369.3.14 HxImageRep HxNJet::getMidx (int *i*) const

Get the specified M component.

```
107 {
108     HxImageRep im;
109     return pointee() ? pointee()->getM(i) : im;
110 }
```

8.369.3.15 HxImageList HxNJet::getLList () const

Get all the L components.

```
154 {
155     HxImageList l;
156 
157     for (int i=0; i < nrComponents(); i++)
158         l += getLidx(i);
159 
160     return l;
161 }
```

8.369.3.16 HxImageList HxNJet::getJList () const

Get all the J components.

```
165 {
166     HxImageList l;
167 
168     if (isColor()) {
169         for (int i=0; i < nrComponents(); i++)
170             l += getJidx(i);
171     }
172 
173     return l;
174 }
```

8.369.3.17 HxImageList HxNJet::getMList () const

Get all the M components.

```
178 {
179     HxImageList l;
180 
181     if (isColor()) {
182         for (int i=0; i < nrComponents(); i++)
183             l += getMidx(i);
184     }
185 
186     return l;
187 }
```

8.369.3.18 HxImageList HxNJet::getList () const

Get all the components.

```
191 {
192     HxImageList l;
193 
194     HxImageList ll = getLList();
195     HxImageList jl = getJList();
196     HxImageList ml = getMList();
197 
198     l = ll + jl;
199     l = l + ml;
200 
201     return l;
202 }
```

8.369.3.19 HxImageRep HxNJet::getLw () const

Get the L gradient magnitude.

```
206 {
207     HxImageRep im;
208     return pointee() ? pointee()->getLw() : im;
209 }
```

8.369.3.20 HxImageRep HxNJet::getJw () const

Get the J gradient magnitude.

```
213 {
214     HxImageRep im;
215     return pointee() ? pointee()->getJw() : im;
216 }
```

8.369.3.21 HxImageRep HxNJet::getMw () const

Get the M gradient magnitude.

```
220 {
221     HxImageRep im;
222     return pointee() ? pointee()->getMw() : im;
223 }
```

8.369.3.22 STD_OSTREAM & HxNJet::put (STD_OSTREAM & *os*) const

Put some information on the given stream.

```
265 {
266     if (isColor())
267         os << "Color ";
268     os << "NJet " << ident() << ", N = " << order()
269        << ", scale = " << scale() << STD_ENDL;
270     return os;
271 }
```

8.369.3.23 int HxNJet::ord2idx (int *i*, int *j*) const [inline]

Translate from ord to idx.

```
161                             {   int n = i+j;
162                                 return n*(n+1)/2+j;}
```

8.369.3.24 int HxNJet::ord2idx (int *i*, int *j*, int *k*) const [inline]

Translate from ord to idx 3D (not supported yet).

```
166                             {   int n = i+j;
167                                 return n*(n+1)/2+j;}
```

8.370 HxPixelAllocator Class Template Reference

Class for (logged) allocation and deallocation of pixel data.

`#include <HxPixelAllocator.h>`

Public Types

- typedef PixelT * **pointer**
- typedef const PixelT * **const_pointer**
- typedef PixelT & **reference**
- typedef const PixelT & **const_reference**
- typedef PixelT **value_type**
- typedef size_t **size_type**

Public Methods

- **HxPixelAllocator** ()
- ~**HxPixelAllocator** ()
- pointer **address** (reference x)
- const_pointer **const_address** (const_reference x)
- pointer **allocate** (size_type n)
- void **deallocate** (pointer p, size_type n=0)

8.370.1 Detailed Description

template<class PixelT> class HxPixelAllocator< PixelT >

Class for (logged) allocation and deallocation of pixel data.

The documentation for this class was generated from the following files:

- **HxPixelAllocator.h**
- HxPixelAllocator.c

8.371 HxPointAndValue Class Reference

this is used to make the image as alist that can be sorted by pixel values.

Public Methods

- **HxPointAndValue** ()
- **HxPointAndValue** (HxPoint2 p1, **HxScalarInt** v1)
- bool **operator**< (const HxPointAndValue &pv) const

Public Attributes

- HxPoint2 **p**
- **HxScalarInt v**

8.371.1 Detailed Description

this is used to make the image as alist that can be sorted by pixel values.

The documentation for this class was generated from the following file:

- HxWatershedSlow.c

8.372 HxPointList Class Reference

Class definition for list of HxPoint's.

`#include <HxPointList.h>`

Public Types

- typedef std::back_insert_iterator< HxPointList > **back_insert_iterator**
  back inserter.

Public Methods

- HxPointList & **operator<<** (const **HxPoint** &)
  Add point to the list.
- void **eraseAll** ()
  Remove all points from the list.

8.372.1 Detailed Description

Class definition for list of HxPoint's.

8.372.2 Member Typedef Documentation

8.372.2.1 typedef std::back_insert_iterator<HxPointList> HxPointList::back_insert_iterator

back inserter.

8.372.3 Member Function Documentation

8.372.3.1 HxPointList & HxPointList::operator<< (const HxPoint & *s*) [inline]

Add point to the list.

```
47 {
48     push_back(s);
49     return *this;
50 }
```

8.372.3.2 void HxPointList::eraseAll () [inline]

Remove all points from the list.

```
54 {
55     erase(begin(), end());
56 }
```

The documentation for this class was generated from the following file:

- **HxPointList.h**

8.373 HxPointR2 Class Reference

Class definition for points in R2 (real-value coordinates).

`#include <HxPointR2.h>`

Public Methods

- **HxPointR2** ()
  Constructor.
- **HxPointR2** (double d1, double d2)
  Constructor.
- **HxPointR2** (const **HxVec2Double** &v)
  Copy constructor.
- double **x** () const
  Get the x coordinate of the point.
- double **y** () const
  Get the y coordinate of the point.
- HxPointR2 **add** (const **HxVectorR2** &arg) const
  Add the given vector to this point.
- HxPointR2 **sub** (const **HxVectorR2** &arg) const
  Subtract the given vector from this point.
- STD_OSTREAM & **put** (STD_OSTREAM &) const
  Put the arrow on the given stream.
- STD_OSTREAM & **dump** (HxPointR2 &) const
- **HxString toString** () const

Friends

- class **HxVectorR2**

8.373.1 Detailed Description

Class definition for points in R2 (real-value coordinates).

8.373.2 Constructor & Destructor Documentation

8.373.2.1 HxPointR2::HxPointR2 () `[inline]`

Constructor.

```
68                          : _data(0,0)
69 {
70 }
```

8.373.2.2 HxPointR2::HxPointR2 (double *d1*, double *d2*) [inline]

Constructor.

```
73                                              : _data(d1, d2)
74 {
75 }
```

8.373.2.3 HxPointR2::HxPointR2 (const HxVec2Double & *v*) [inline]

Copy constructor.

```
78                                               : _data(v)
79 {
80 }
```

8.373.3 Member Function Documentation

8.373.3.1 double HxPointR2::x () const [inline]

Get the x coordinate of the point.

```
84 {
85     return _data.x();
86 }
```

8.373.3.2 double HxPointR2::y () const [inline]

Get the y coordinate of the point.

```
90 {
91     return _data.y();
92 }
```

8.373.3.3 HxPointR2 HxPointR2::add (const HxVectorR2 & *arg*) const

Add the given vector to this point.

```
16 {
17     return HxPointR2(_data + arg._data );
18
19 }
```

8.373.3.4 HxPointR2 HxPointR2::sub (const HxVectorR2 & *arg*) const

Subtract the given vector from this point.

```
23 {
24     return HxPointR2(_data - arg._data);
25 }
```

8.373.3.5 STD_OSTREAM & HxPointR2::put (STD_OSTREAM & *os*) const [inline]

Put the arrow on the given stream.

```
102 {
103     return os << _data;
104 }
```

The documentation for this class was generated from the following files:

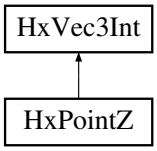
- **HxPointR2.h**
- HxPointR2.c

8.374 HxPointZ Class Reference

Definition of a point in Z3 space using integer coordinates.

`#include <HxPointZ.h>`

Inheritance diagram for HxPointZ::



Public Methods

- **HxPointZ** (int x=0, int y=0, int z=0)

  Constructor.

- **HxPointZ** (const **HxVec3Int** &rhs)

  Constructor.

- **HxPointZ** (const **HxVec3Double** &rhs)

  Constructor.

8.374.1 Detailed Description

Definition of a point in Z3 space using integer coordinates.

HxPointZ is used primarily to specify the position of a pixel in an image.

8.374.2 Constructor & Destructor Documentation

8.374.2.1 HxPointZ::HxPointZ (int *x* = 0, int *y* = 0, int *z* = 0) [inline]

Constructor.

```
34                                          : HxVec3Int(x, y, z)
35 {
36 }
```

8.374.2.2 HxPointZ::HxPointZ (const HxVec3Int & *rhs*) [inline]

Constructor.

```
40     : HxVec3Int(rhs.x(), rhs.y(), rhs.z())
41 {
42 }
```

8.374.2.3 HxPointZ::HxPointZ (const HxVec3Double & *rhs*) [inline]

Constructor.

```
46     : HxVec3Int(rhs.x()+0.5, rhs.y()+0.5, rhs.z()+0.5)
47 {
48 }
```

The documentation for this class was generated from the following file:

- **HxPointZ.h**

8.375 HxPointZList Class Reference

Class definition for list of **HxPointZ** (p. 1077)'s.

`#include <HxPointZList.h>`

Public Methods

- HxPointZList & **operator**<< (const **HxPointZ** &)
  Add point to the list.
- void **eraseAll** ()
  Remove all points from the list.

8.375.1 Detailed Description

Class definition for list of **HxPointZ** (p. 1077)'s.

Specialization of list from STL.

8.375.2 Member Function Documentation

8.375.2.1 HxPointZList & HxPointZList::operator<< (const HxPointZ & *s*) [inline]

Add point to the list.

```
97 {
98     push_back(s);
99     return *this;
100 }
```

8.375.2.2 void HxPointZList::eraseAll () [inline]

Remove all points from the list.

```
104 {
105     erase(begin(), end());
106 }
```

The documentation for this class was generated from the following file:

- **HxPointZList.h**

8.376 HxPolyline2d Class Reference

A simple class for storing polylines and polygons.

`#include <HxPolyline2d.h>`

Public Methods

- **HxPolyline2d** ()

  Construct an empty polyline.

- **HxPolyline2d** (const HxPointSetR2 &v, int close)

  Construct a polyline or polygon (closed) from the given set of points.

- **HxPolyline2d** (double *px, double *py, int np, int close)

  Construct a polyline or polygon (closed) from the given set of coordinates.

- ~**HxPolyline2d** ()

  Destructor.

- int **ident** () const

  Get the identifier of this object.

- HxPointSetR2 **getPoints** () const

  Get the points of the object.

- int **getClosed** () const

  Indicate whether this is a polyline or polygon.

- int **getNrPoints** () const

  Get the number of points.

- **HxPointR2 getPoint** (int index) const

  Get the points at the given index.

- void **getPoints** (double *px, double *py) const

  Fill the given arrays with the coordinates of the points of this object.

- STD_OSTREAM & **put** (STD_OSTREAM &) const

  Put this object on the given output stream.

8.376.1 Detailed Description

A simple class for storing polylines and polygons.

The difference between a polyline and polygon is the closed parameter. The number of points is the same, i.e. in a polygon the start/end point is NOT repeated in the list of points.

8.376.2 Constructor & Destructor Documentation

8.376.2.1 HxPolyline2d::HxPolyline2d () [inline]

Construct an empty polyline.

```
80 {
81     _ident = _nr++;
82 }
```

8.376.2.2 HxPolyline2d::HxPolyline2d (const HxPointSetR2 & *v*, int *close*) [inline]

Construct a polyline or polygon (closed) from the given set of points.

```
85                                                          :
86     _points(v), _closed(close)
87 {
88     _ident = _nr++;
89 }
```

8.376.2.3 HxPolyline2d::HxPolyline2d (double * *px*, double * *py*, int *np*, int *close*) [inline]

Construct a polyline or polygon (closed) from the given set of coordinates.

```
93 {
94     for (int i=0 ; i<np ; i++)
95         _points.push_back(HxPointR2(*px++, *py++));
96     _closed = close;
97     _ident = _nr++;
98 }
```

8.376.2.4 HxPolyline2d::~HxPolyline2d () [inline]

Destructor.

```
102 {
103 }
```

8.376.3 Member Function Documentation

8.376.3.1 int HxPolyline2d::ident () const [inline]

Get the identifier of this object.

```
107 {
108     return _ident;
109 }
```

8.376.3.2 HxPointSetR2 HxPolyline2d::getPoints () const [inline]

Get the points of the object.

```
113 {
114     return _points;
115 }
```

8.376.3.3 int HxPolyline2d::getClosed () const [inline]

Indicate whether this is a polyline or polygon.

```
119 {
120     return _closed;
121 }
```

8.376.3.4 int HxPolyline2d::getNrPoints () const [inline]

Get the number of points.

```
125 {
126     return _points.size();
127 }
```

8.376.3.5 HxPointR2 HxPolyline2d::getPoint (int *index*) const [inline]

Get the points at the given index.

```
131 {
132     return _points[index];
133 }
```

8.376.3.6 void HxPolyline2d::getPoints (double * *px*, double * *py*) const

Fill the given arrays with the coordinates of the points of this object.

The size of the araays is assumed to match the number of points.

```
18 {
19     HxPointSetR2::const_iterator it = _points.begin();
20     while (it != _points.end()) {
21         *px++ = (*it).x();
22         *py++ = (*it).y();
23         it++;
24     }
25 }
```

8.376.3.7 STD_OSTREAM & HxPolyline2d::put (STD_OSTREAM & *os*) const

Put this object on the given output stream.

```
29 {
30     HxPointSetR2::const_iterator it = _points.begin();
31     while (it != _points.end()) {
32         os << (*it) << ", ";
33         it++;
34     }
35     return os << "closed: " << _closed << STD_ENDL;
36 }
```

The documentation for this class was generated from the following files:

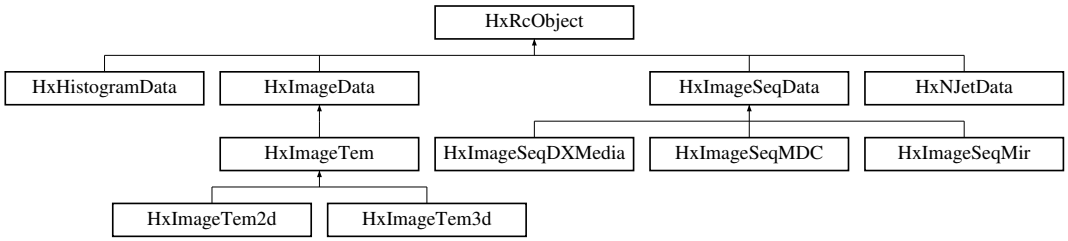
- **HxPolyline2d.h**
- HxPolyline2d.c

8.377 HxRcObject Class Reference

Base class for reference counted objects.

`#include <HxRcObject.h>`

Inheritance diagram for HxRcObject::



Public Methods

- HxRcObject * **addRef** ()
- void **removeRef** ()
- HxRcObject * **assign** (HxRcObject *rhs)
- int **isShared** () const
- HxRcObject * **getUnshared** ()

8.378.1 Detailed Description

template<class T> class HxRcPtr< T >

Template class for (smart) pointers to reference counted objects, i.e.

objects derived from **HxRcObject** (p. 1082).

The documentation for this class was generated from the following file:

- **HxRcPtr.h**

8.379 HxRegData Class Reference

A registry value.

`#include <HxRegData.h>`

Public Types

- enum **RvType** { **Int**, **String** }

  The type of the data.

Public Methods

- **HxRegData** ()

  Constructor.

- **HxRegData** (**HxString**)

  Constructor.

- **HxRegData** (int)

  Constructor.

- **HxRegData** (const HxRegData &)

  Constructor.

- ~**HxRegData** ()

  Desstructor.

- HxRegData & **operator=** (const HxRegData &)
  Assignment operator.
- **RvType type** () const
  Get type of data.
- void **setString** (**HxString**)
  Set string data.
- **HxString getString** () const
  Get string data.
- void **setInt** (int)
  Set int data.
- int **getInt** () const
  Get int data.
- **HxString toString** () const
  Output to string.
- STD_OSTREAM & **put** (STD_OSTREAM &, int cCode=0) const
  Put on stream.

8.379.1 Detailed Description

A registry value.

8.379.2 Member Enumeration Documentation

8.379.2.1 enum HxRegData::RvType

The type of the data.

```
41 { Int, String } RvType;
```

8.379.3 Constructor & Destructor Documentation

8.379.3.1 HxRegData::HxRegData () [inline]

Constructor.

```
84 {
85     _type = String;
86     new((void*)&(_val._str[0])) HxPnString(HxString());
87 }
```

8.379.3.2 HxRegData::HxRegData (HxString *s*) [inline]

Constructor.

```
91 {
92     _type = String;
93     new((void*)&(_val._str[0])) HxPnString(s);
94 }
```

8.379.3.3 HxRegData::HxRegData (int *i*) [inline]

Constructor.

```
98 {
99     _type = Int;
100     _val._int = i;
101 }
```

8.379.3.4 HxRegData::HxRegData (const HxRegData & *rhs*)

Constructor.

```
15 {
16     _type = rhs._type;
17     switch (_type) {
18     case Int    :
19         _val._int = rhs._val._int;
20         break;
21     case String :
22         new((void*)&(_val._str[0]))
23             HxPnString(((HxPnString*)&(rhs._val._str[0]))->toString());
24         break;
25     }
26 }
```

8.379.3.5 HxRegData::~HxRegData () [inline]

Desstructor.

```
105 {
106     if (_type == String)
107         ((HxPnString*)&(_val._str[0]))->~HxPnString();
108 }
```

8.379.4 Member Function Documentation

8.379.4.1 HxRegData & HxRegData::operator= (const HxRegData & *rhs*)

Assignment operator.

```
30 {
31     if (_type == String)

39         new((void*)&(_val._str[0]))
40             HxPnString(((HxPnString*)&(rhs._val._str[0]))->toString());
41         break;
42     }
43     return *this;
44 }
```

8.379.4.2 HxRegData::RvType HxRegData::type () const [inline]

Get type of data.

```
112 {
113     return _type;
114 }
```

8.379.4.3 void HxRegData::setString (HxString *s*) [inline]

Set string data.

```
118 {
119     if (_type == String)
120         ((HxPnString*)&(_val._str[0]))->~HxPnString();
121     new((void*)&(_val._str[0])) HxPnString(s);
122     _type = String;
123 }
```

8.379.4.4 HxString HxRegData::getString () const [inline]

Get string data.

```
127 {
128     return (_type == String) ?
129                 ((HxPnString*)&(_val._str[0]))->toString() :
130                 HxString();
131 }
```

8.379.4.5 void HxRegData::setInt (int *i*) [inline]

Set int data.

```
135 {
136     if (_type == String)
137         ((HxPnString*)&(_val._str[0]))->~HxPnString();
138     _val._int = i;
139     _type = Int;
140 }
```

8.379.4.6 int HxRegData::getInt () const [inline]

Get int data.

```
144 {
145     return (_type == Int) ? _val._int : 0 ;
146 }
```

8.379.4.7 HxString HxRegData::toString () const

Output to string.

```
48 {
49     switch (_type) {
50     case Int    :
51         return makeString(_val._int);
52     case String :
53         return ((HxPnString*)&(_val._str[0]))->toString();
54     default     :
55         return HxString("\"") + __FILE__ + "\", line " + makeString(__LINE__)
56             + ": Implementation error";
57     }
58 }
```

8.379.4.8 STD_OSTREAM & HxRegData::put (STD_OSTREAM & *os*, int *cCode* = 0) const

Put on stream.

```
62 {
63     HxString quote = cCode ? "\\\"" : "\"";
64     switch (_type) {
65     case Int    :
66         os << _val._int;

- HxRegData.c

8.380 HxRegistry Class Reference

The registry.

`#include <HxRegistry.h>`

Public Methods

- **HxRegistry** ()
  Constructor.
- ∼**HxRegistry** ()
  Destructor.
- int **import** (**HxString** fileName)
  Import registry data from file.
- int **import** (const char ∗argv[ ])
  Import registry data from argument strings.
- int **exportText** (STD_OSTREAM &out) const
  Export registry data as text to stream.
- int **exportC** (STD_OSTREAM &out, **HxString** label) const
  Export registry data in format for use with **HxRegistryImporter** (p. 1095).
- **HxRegKey** ∗ **insertKey** (**HxString** path)
  Insert key.
- void **eraseKey** (**HxString** path)
  Erase key.
- **HxRegKey** ∗ **findKey** (**HxString** path) const
  Find key.
- void **insertValue** (**HxString** path, const **HxRegData** &)
  Insert value.
- void **insertValue** (**HxString** path, **HxString** data)
  Insert value.
- void **insertValue** (**HxString** path, int data)
  Insert value.
- void **eraseValue** (**HxString** path)
  Erase value.
- **HxString findValue** (**HxString** path) const
  Find value.
- int **valueExists** (**HxString** path) const
  Check whether value exists.
- **HxRegKey** ∗ **setCursorKey** (**HxString** path)
  Set cursor key.

- **HxRegKey** ∗ **setCursorUp** ()
  Move cursor key up.
- **HxRegKey** ∗ **getCursorKey** () const
  Get cursor key.
- **HxString getCursorName** () const
  Get cursor name.
- **HxRegKey** ∗ **setRootKey** ()
  Set root key.
- **HxRegKey** ∗ **getRootKey** () const
  Get root key.
- STD_OSTREAM & **put** (STD_OSTREAM &) const
  Put registry on stream.

Static Public Methods

- HxRegistry & **instance** ()
  Access to the single instance of the registry.

- **HxString className** ()
  The name : "DirectNC".

8.389.1 Detailed Description

template<class ValT, class ValDoubleT> class HxRgbDirectNC< ValT, ValDoubleT >

Direct display mapping pixV is RGB value in the range 0-255.

No clipping if pixV is out of range.

8.389.2 Member Typedef Documentation

8.389.2.1 template<class ValT, class ValDoubleT> typedef ValDoubleT HxRgbDirectNC::ArithTypeDouble

The "double" arithtype.

8.389.3 Constructor & Destructor Documentation

8.389.3.1 template<class ValT, class ValDoubleT> HxRgbDirectNC< ValT, ValDoubleT >::HxRgbDirectNC (HxTagList &) [inline]

Constructor : empty.

```
58                              {}
```

8.389.4 Member Function Documentation

8.389.4.1 template<class ValT, class ValDoubleT> int HxRgbDirectNC< ValT, ValDoubleT >::doIt (const ValT & *pixV*) [inline]

Actual operation for the "standard" arithtype.

```
62                              {
63                                  HxVec3Int v = (HxVec3Int) pixV;
64                                  return (255 << 24) | (v.x() << 16) | (v.y() << 8) | v.z();
65                              }
```

8.389.4.2 template<class ValT, class ValDoubleT> int HxRgbDirectNC< ValT, ValDoubleT >::doItDouble (const ValDoubleT & *pixV*) [inline]

Actual operation for the "double" arithtype.

```
69                              {
70                                  HxVec3Int v = (HxVec3Int) pixV;
71                                  return (255 << 24) | (v.x() << 16) | (v.y() << 8) | v.z();
72                              }
```

- **HxRgbXYZ.h**

8.398 HxSampledBSplineCurve Class Reference

Class definition for sampled BSpline curves.

`#include <HxSampledBSplineCurve.h>`

Public Methods

- **HxSampledBSplineCurve** ()

  Construct default curve.

- **HxSampledBSplineCurve** (const **HxBSplineCurve** &curve, int nSamples, HxBSplineSampling-Alg algorithm=samplingResolution)

  Construct a curve with given number of samples.

- **HxSampledBSplineCurve** (const **HxBSplineCurve** &curve, double pathInterval, HxBSpline-SamplingAlg algorithm)

  Construct a curve with given path interval between samples.

- ~**HxSampledBSplineCurve** ()

  Destructor.

- int **ident** () const
  Get the identifier.
- **HxBSplineCurve continuousCurve** () const
  Get the continuous curve of this object.
- HxBSplineType **curveType** () const
  Get the type of this curve.
- HxBSplineSamplingAlg **samplingAlg** () const
  Get the sampling algorithm.
- int **nSamples** () const
  Get the number of samples.
- double **sampledT** (int j) const
  Get value of t for sample j.
- vector< double > **allSampledT** () const
  Get value of t for all samples.
- int **indexOfT** (double t) const
  Get index of sample corresponding to given t.
- double **dT** (int j) const
  sampling interval at sample j .
- **HxSampledBSplineInterval sampledInterval** (int j1, int j2) const
  Get curve interval defined by two curve samples j1, j2.
- vector< int > **samplesAffectedBy** (int i) const
  Get list of curve samples affected by control point i.
- **HxSampledBSplineInterval intervalAffectedBy** (int i) const
  Get curve interval affected by control point i.
- vector< int > **PThatAffectSample** (int i) const
  Get all control points with influence on the position of curve sample i.
- double **B** (int i, int j) const
  Get value of basis i for sample j.
- vector< double > **BAll** (int j) const
  Get value of all basis that affect sample j.
- double **dB** (int order, int i, int j) const
  Get derivative of basis i for sample j.
- vector< double > **dBAll** (int order, int j) const
  Get derivative of all basis that affect sample j (given order).

- **HxPointR2 C** (int j) const
  Get curve point for sample j.
- HxPointSetR2 **AllC** () const
  Get all sampled curve points.
- **HxPolyline2d CPoly** () const
  Polyline with all sampled curve points.
- **HxVectorR2 dC** (int order, int j) const
  Get curve derivative at sample j.
- vector< **HxVectorR2** > **dCAll** (int order) const
  Get curve derivative at all samples.
- double **kAtC** (int j) const
  Get curvature at sample j.
- vector< double > **kAtCAll** () const
  Get curve derivative at all samples.
- double **dTurnAngleAtC** (int j) const
  Derivative of turning angle at sample j.
- vector< double > **dTurnAngleAtCAll** () const
  Derivative of turning angle at all samples.
- double **length** () const
  total curve length.
- double **length** (int j1, int j2) const
  length of interval between given samples.
- double **length** (const **HxSampledBSplineInterval** &interval) const
  length of given interval.
- int **closestSample** (const **HxPointR2** &p) const
  Get index of sample that is closest to the given point.
- int **numP** () const
  Get number of control points.
- HxPointSetR2 **allP** () const
  Get all control points.
- **HxPolyline2d controlP** () const
  Get the control polygon.
- HxSampledBSplineCurve **changeAllP** (const HxPointSetR2 &p) const

Replace all control points by given points.

- HxSampledBSplineCurve **translateCurve** (const **HxVectorR2** &v, const **HxSampledBSplineInterval** &interval) const

  Add vector to control points that affect the curve in the given interval.

- STD_OSTREAM & **dump** (STD_OSTREAM &) const

  Dump the curve on the given stream.

Static Public Methods

- HxSampledBSplineCurve **makeUniform** (**HxPolyline2d** cp, int degree, double distance)

  Make a curve with uniform knots.

- HxSampledBSplineCurve **makeInterpolating** (**HxPolyline2d** cp, double distance)

  Make an interpolating curve.

8.398.1 Detailed Description

Class definition for sampled BSpline curves.

8.398.2 Constructor & Destructor Documentation

8.398.2.1 HxSampledBSplineCurve::HxSampledBSplineCurve ()

Construct default curve.

```
19 {

286         double d = v.magnitude();
287         if ( d < dMin ) {
288             dMin = d;
289             iMin = i;
290         }
291     }
292
293     return iMin;
294 }
```

8.398.3.33 int HxSampledBSplineCurve::numP () const [inline]

Get number of control points.

```
237 {
238     return _curve.numP();
239 }
```

8.398.3.34 HxPointSetR2 HxSampledBSplineCurve::allP () const [inline]

Get all control points.

```
243 {
244     return _curve.allP();
245 }
```

8.398.3.35 HxPolyline2d HxSampledBSplineCurve::controlP () const [inline]

Get the control polygon.

```
249 {
250     return HxPolyline2d(allP(), (curveType() == closed));
251 }
```

8.398.3.36 HxSampledBSplineCurve HxSampledBSplineCurve::changeAllP (const HxPointSetR2 & *p*) const [inline]

Replace all control points by given points.

```
279 {
280     HxSampledBSplineCurve tmp = *this;
281     tmp._curve = _curve.changeAllP(p);
282     return tmp;
283 }
```

8.398.3.37 HxSampledBSplineCurve HxSampledBSplineCurve::translateCurve (const HxVectorR2 & *translVec*, const HxSampledBSplineInterval & *interval*) const

Add vector to control points that affect the curve in the given interval.

This will translate a part of the curve in the given direction.

```
305 {
306     HxVectorR2 v = translVec;
307     HxPointSetR2 P = _curve.allP();
308     HxBSplineInterval tmp(sampledT(interval.begin()), sampledT(interval.end()),
309         _curve.minT(), _curve.maxT(), curveType());
310     vector<int> index = _curve.PThatAffectCAt(tmp);
311     for ( int i =0; i < index.size(); i++) {
312         int j = index[i];
313         P[j] =  P[j].add(v);
314     }
315
316     return changeAllP(P);
317 }
```

8.398.3.38 STD_OSTREAM & HxSampledBSplineCurve::dump (STD_OSTREAM & *os*) const

Dump the curve on the given stream.

```
325 {
326     _curve.dump(os);
327
328     os << "Sampling Algorithm: " << samplingAlg();
329
330     if ( _t.empty() ) {
331         os << "\nNo Samples";
332     } else {
333         os << "\nT Vector: " << _t.size() << " samples\n";
334         for ( int i = 0; i < _t.size(); i++ ) {
335             os << _t[i] << ",";
336         }
337     }
338
339     os << STD_ENDL;
340     return os;
341 }
```

8.399 HxSampledBSplineInterval Class Reference

Class definition for path interval in sampled curves (oriented).

`#include <HxSampledBSplineInterval.h>`

Public Methods

- **HxSampledBSplineInterval** ()

  Default constructor.

- **HxSampledBSplineInterval** (int b, int e, int max, HxBSplineType type)

  Construct given interval.

- ~**HxSampledBSplineInterval** ()

  Destructor.

- int **begin** () const

  First sample.

- int **end** () const

  Last sample.

- int **next** (int i) const

  Next sample index in the interval (consider wrapping).

- int **contains** (int i) const

  Determine if the sample is inside the interval.

- int **middle** () const

central sample in interval.

- int **ratio** (double r) const

  Index of sample inside the interval with given distance from begin.

- int **size** () const

  number of samples in the interval.

8.399.1 Detailed Description

Class definition for path interval in sampled curves (oriented).

Interval = [first, second]. Values correspond to indices, and not to the path parameters. Possible interval: [0,max]. For open paths, first $<$ second (always). For closed paths, first $>$ second indicates wrap around 0.

8.399.2 Constructor & Destructor Documentation

8.399.2.1 HxSampledBSplineInterval::HxSampledBSplineInterval () [inline]

Default constructor.

```
71                                                  : pair<int,int>()
72 {
73     _max = 0;
74     _wrap = 0;
75 }
```

8.399.2.2 HxSampledBSplineInterval::HxSampledBSplineInterval (int *b*, int *e*, int *max*, HxBSplineType *type*) [inline]

Construct given interval.

```
79                                  : pair<int,int>(b,e)
80 {
81     _max = max;
82     _wrap = (type == closed);
83 }
```

8.399.2.3 HxSampledBSplineInterval::~HxSampledBSplineInterval () [inline]

Destructor.

```
87 {
88 }
```

8.399.3 Member Function Documentation

8.399.3.1 int HxSampledBSplineInterval::begin () const [inline]

First sample.

```
92 {
93     return first;
94 }
```

8.399.3.2 int HxSampledBSplineInterval::end () const [inline]

Last sample.

```
98 {
99     return second;
100 }
```

8.399.3.3 int HxSampledBSplineInterval::next (int *i*) const [inline]

Next sample index in the interval (consider wrapping).

```
104 {
105     if ( _wrap ) {
106         if ( i >= _max )    // is wrapped?
107             return _max-i;
108         else    return i+1;
109     } else  if ( i >= _max )
110             return _max-1;
111         else    return i+1;
112 }
```

8.399.3.4 int HxSampledBSplineInterval::contains (int *i*) const [inline]

Determine if the sample is inside the interval.

Consider wrapping for closed curves.

```
116 {
117     if ( first == second ) // special case?
118         return (i >= 0 && i < _max);
119     if ( first > second )   // is wrapped?
120         return (i >= first && i < _max) || (i >= 0 && i <= second);
121     else    return (i >= first && i <= second);
122 }
```

8.399.3.5 int HxSampledBSplineInterval::middle () const [inline]

central sample in interval.

```
126 {
127     return ratio(0.5);
128 }
```

8.399.3.6 int HxSampledBSplineInterval::ratio (double *r*) const [inline]

Index of sample inside the interval with given distance from begin.

```
132 {
133     int index = size() * r + first;
134     if ( index >= _max )
135         index -= _max;
136     return index;
137 }
```

8.399.3.7 int HxSampledBSplineInterval::size () const [inline]

number of samples in the interval.

```
142 {
143     if ( first <= second ) {
144         return second - first + 1;
145     } else  {
146         int count = 0;
147         for ( int i=first; i != second; i = next(i) )
148             count++;
149         return count+1;
150     }
151 }
```

- **HxSampledBSplineInterval.h**

8.400 HxScalarDouble Class Reference

Class definition scalar double.

`#include <HxScalarDouble.h>`

Constructors

- **HxScalarDouble** ()

  Default constructor.

- **HxScalarDouble** (double v)

  Conversion from native type.

- **HxScalarDouble** (const HxScalarDouble &rhs)

  Copy constructor.

Inquiry

- int **dim** () const
  Dimensionality.
- double **x** () const
  Value of (first) element.
- double **getValue** (int dimension) const
  Element in given dimension.
- void **setValue** (int dimension, double value)

Conversion

- **operator HxScalarInt** () const
  Cast to **HxScalarInt** (p. 1164).
- **operator HxVec2Int** () const
  Cast to **HxVec2Int** (p. 1281).
- **operator HxVec2Double** () const
  Cast to **HxVec2Double** (p. 1262).
- **operator HxVec3Int** () const
  Cast to **HxVec3Int** (p. 1321).
- **operator HxVec3Double** () const
  Cast to **HxVec3Double** (p. 1301).
- **operator HxComplex** () const
  Cast to **HxComplex** (p. 506).

Operators

Mathematical definition: **Binary operations on pixel values** (p. 5)

- int **operator==** (const HxScalarDouble &v) const
  Equal.
- int **operator!=** (const HxScalarDouble &v) const
  Not equal.
- int **operator<** (const HxScalarDouble &v) const
  Less than.
- int **operator<=** (const HxScalarDouble &v) const
  Less equal.

- int **operator**> (const HxScalarDouble &v) const
  Greater than.
- int **operator**>= (const HxScalarDouble &v) const
  Greater equal.
- const HxScalarDouble **SMALL_VAL** = -1e300
  A small value w.r.t to the comparison operators "<" and ">".
- const HxScalarDouble **LARGE_VAL** = 1e300
  A large value w.r.t to the comparison operators "<" and ">".

Unary operations

Mathematical definition: **Unary operations on pixel values** (p. 4)

- HxScalarDouble **operator-** () const
  Negation.
- HxScalarDouble **complement** () const
  Complement.
- HxScalarDouble **abs** () const
  Absolute value.
- HxScalarDouble **ceil** () const
  Ceiling.
- HxScalarDouble **floor** () const
  Floor.
- HxScalarDouble **round** () const
  Round.
- HxScalarDouble **sum** () const
  Sum.
- HxScalarDouble **product** () const
  Product.
- HxScalarDouble **min** () const
  Minimum.
- HxScalarDouble **max** () const
  Maximum.
- HxScalarDouble **norm1** () const

L1 norm.

- HxScalarDouble **norm2** () const
  L2 norm.
- HxScalarDouble **normInf** () const
  L infinity norm.
- HxScalarDouble **sqrt** () const
  Square root.
- HxScalarDouble **sin** () const
  Sine.
- HxScalarDouble **cos** () const
  Cosine.
- HxScalarDouble **tan** () const
  Tangent.
- HxScalarDouble **asin** () const
  Arc sine.
- HxScalarDouble **acos** () const
  Arc cosine.
- HxScalarDouble **atan** () const
  Arc tangent.
- HxScalarDouble **atan2** () const
  Arc tangent.
- HxScalarDouble **sinh** () const
  Hyperbolic sine.
- HxScalarDouble **cosh** () const
  Hyperbolic cosine.
- HxScalarDouble **tanh** () const
  Hyperbolic tangent.
- HxScalarDouble **exp** () const
  Exponent.
- HxScalarDouble **log** () const
  Natural logarithm.
- HxScalarDouble **log10** () const
  Base 10 logarithm.

Binary operations

Mathematical definition: **Binary operations on pixel values** (p. 5)

- HxScalarDouble & **operator+=** (const HxScalarDouble &v)
  Addition and assignment.
- HxScalarDouble & **operator-=** (const HxScalarDouble &v)
  Subtraction and assignment.
- HxScalarDouble & **operator** ∗**=** (const HxScalarDouble &v)
  Multiplication and assignment.
- HxScalarDouble & **operator/=** (const HxScalarDouble &v)
  Division and assignment.
- HxScalarDouble **min** (const HxScalarDouble &v) const
  Minimum.
- HxScalarDouble & **minAssign** (const HxScalarDouble &v)
  Minimum and assignment.
- HxScalarDouble **max** (const HxScalarDouble &v) const
  Maximum.
- HxScalarDouble & **maxAssign** (const HxScalarDouble &v)
  Maximum and assignment.
- HxScalarDouble **inf** (const HxScalarDouble &v) const
  Infimum.
- HxScalarDouble & **infAssign** (const HxScalarDouble &v)
  Infimum and assignment.
- HxScalarDouble **sup** (const HxScalarDouble &v) const
  Supremum.
- HxScalarDouble & **supAssign** (const HxScalarDouble &v)
  Supremum and assignment.
- HxScalarDouble **pow** (const HxScalarDouble &v) const
  Power.
- HxScalarDouble **mod** (const HxScalarDouble &v) const
  Modulo.
- HxScalarDouble **and** (const HxScalarDouble &v) const
  And.
- HxScalarDouble **or** (const HxScalarDouble &v) const

Or.

- HxScalarDouble **xor** (const HxScalarDouble &v) const
  Xor.
- HxScalarDouble **leftShift** (const HxScalarDouble &v) const
  Left shift.
- HxScalarDouble **rightShift** (const HxScalarDouble &v) const
  Right shift.
- HxScalarDouble **dot** (const HxScalarDouble &v) const
  Dot product.
- HxScalarDouble **cross** (const HxScalarDouble &v) const
  Cross product.
- HxScalarDouble **operator+** (const HxScalarDouble &v1, const HxScalarDouble &v2)
  Addition.
- HxScalarDouble **operator-** (const HxScalarDouble &v1, const HxScalarDouble &v2)
  Subtraction.
- HxScalarDouble **operator** * (const HxScalarDouble &v1, const HxScalarDouble &v2)
  Multiplication.
- HxScalarDouble **operator/** (const HxScalarDouble &v1, const HxScalarDouble &v2)
  Division.

Output

- STD_OSTREAM & **put** (STD_OSTREAM &os) const
  Print value on stream.
- **HxString toString** () const
  Value as a string.

Public Methods

- void * **operator new** (size_t, void *=0)
- HxScalarDouble & **operator=** (const double &v)
- HxScalarDouble & **operator=** (const HxScalarDouble &rhs)

8.400.1 Detailed Description

Class definition scalar double.

8.400.2 Constructor & Destructor Documentation

8.400.2.1 HxScalarDouble::HxScalarDouble () [inline]

Default constructor.

```

694     return (*this);
695 }
```

8.400.3.58 HxScalarDouble HxScalarDouble::or (const HxScalarDouble & *v*) const [inline]

Or.

```
699 {
700     return (*this);
701 }
```

8.400.3.59 HxScalarDouble HxScalarDouble::xor (const HxScalarDouble & *v*) const [inline]

Xor.

```
705 {
706     return (*this);
707 }
```

8.400.3.60 HxScalarDouble HxScalarDouble::leftShift (const HxScalarDouble & *v*) const [inline]

Left shift.

```
711 {
712     return (*this);
713 }
```

8.400.3.61 HxScalarDouble HxScalarDouble::rightShift (const HxScalarDouble & *v*) const [inline]

Right shift.

```
717 {
718     return (*this);
719 }
```

8.400.3.62 HxScalarDouble HxScalarDouble::dot (const HxScalarDouble & *v*) const

Dot product.

```
69 {
70     return _value * v._value;
71 }
```

8.400.3.63 HxScalarDouble HxScalarDouble::cross (const HxScalarDouble & *v*) const [inline]

Cross product.

```
723 {
724     return HxScalarDouble(0.0);
725 }
```

8.400.3.64 STD_OSTREAM & HxScalarDouble::put (STD_OSTREAM & *os*) const

Print value on stream.

For global operator<<

```
75 {
76     return os << _value;
77 }
```

8.400.3.65 HxString HxScalarDouble::toString () const [inline]

Value as a string.

```
729 {
730     return makeString(_value);
731 }
```

8.400.4 Friends And Related Function Documentation

8.400.4.1 HxScalarDouble operator+ (const HxScalarDouble & *v1*, const HxScalarDouble & *v2*) [friend]

Addition.

```
601 {
602     return HxScalarDouble(v1._value + v2._value);
603 }
```

8.400.4.2 HxScalarDouble operator- (const HxScalarDouble & *v1*, const HxScalarDouble & *v2*) [friend]

Subtraction.

```
607 {
608     return HxScalarDouble(v1._value - v2._value);
609 }
```

8.400.4.3 HxScalarDouble operator * (const HxScalarDouble & *v1*, const HxScalarDouble & *v2*) [friend]

Multiplication.

```
613 {
614     return HxScalarDouble(v1._value * v2._value);
615 }
```

8.400.4.4 HxScalarDouble operator/ (const HxScalarDouble & *v1*, const HxScalarDouble & *v2*) [friend]

Division.

```
619 {
620     return HxScalarDouble(v1._value / v2._value);
621 }
```

8.400.5 Member Data Documentation

8.400.5.1 const HxScalarDouble HxScalarDouble::SMALL_VAL = -1e300 [static]

A small value w.r.t to the comparison operators "<" and ">".

Not actually the minimum to avoid overflow.

8.400.5.2 const HxScalarDouble HxScalarDouble::LARGE_VAL = 1e300 [static]

A large value w.r.t to the comparison operators "<" and ">".

Not actually the maximum to avoid overflow.

The documentation for this class was generated from the following files:

- **HxScalarDouble.h**
- HxScalarDouble.c

8.401 HxScalarInt Class Reference

Class definition scalar integer.

`#include <HxScalarInt.h>`

Constructors

- **HxScalarInt** ()
  Default constructor.
- **HxScalarInt** (int v)
  Conversion from native type.
- **HxScalarInt** (const HxScalarInt &v)
  Copy constructor.

Inquiry

- int **dim** () const
  Dimensionality.
- int **x** () const
  Value of (first) element.
- int **getValue** (int dimension) const
  Element in given dimension.
- void **setValue** (int dimension, int value)

Conversion

- **operator HxScalarDouble** () const
  Cast to **HxScalarDouble** (p. 1145).
- **operator HxVec2Int** () const
  Cast to **HxVec2Int** (p. 1281).
- **operator HxVec2Double** () const
  Cast to **HxVec2Double** (p. 1262).
- **operator HxVec3Int** () const
  Cast to **HxVec3Int** (p. 1321).
- **operator HxVec3Double** () const
  Cast to **HxVec3Double** (p. 1301).
- **operator HxComplex** () const
  Cast to **HxComplex** (p. 506).

Operators

Mathematical definition: **Binary operations on pixel values** (p. 5)

- int **operator==** (const HxScalarInt &v) const
  Equal.
- int **operator!=** (const HxScalarInt &v) const
  Not equal.
- int **operator**< (const HxScalarInt &v) const
  Less than.
- int **operator**<= (const HxScalarInt &v) const
  Less equal.
- int **operator**> (const HxScalarInt &v) const
  Greater than.
- int **operator**>= (const HxScalarInt &v) const
  Greater equal.
- const HxScalarInt **SMALL_VAL** = -200000000
  A small value w.r.t to the comparison operators "<" and ">".
- const HxScalarInt **LARGE_VAL** = 200000000
  A large value w.r.t to the comparison operators "<" and ">".

Unary operations

Mathematical definition: **Unary operations on pixel values** (p. 4)

- HxScalarInt **operator-** () const
  Negation.
- HxScalarInt **complement** () const
  Complement.
- HxScalarInt **abs** () const
  Absolute value.
- HxScalarInt **ceil** () const
  Ceiling.
- HxScalarInt **floor** () const
  Floor.
- HxScalarInt **round** () const

Round.

- HxScalarInt **sum** () const
  Sum.
- HxScalarInt **product** () const
  Product.
- HxScalarInt **min** () const
  Minimum.
- HxScalarInt **max** () const
  Maximum.
- HxScalarInt **norm1** () const
  L1 norm.
- **HxScalarDouble norm2** () const
  L2 norm.
- HxScalarInt **normInf** () const
  L infinity norm.
- **HxScalarDouble sqrt** () const
  Square root.
- **HxScalarDouble sin** () const
  Sine.
- **HxScalarDouble cos** () const
  Cosine.
- **HxScalarDouble tan** () const
  Tangent.
- **HxScalarDouble asin** () const
  Arc sine.
- **HxScalarDouble acos** () const
  Arc cosine.
- **HxScalarDouble atan** () const
  Arc tangent.
- **HxScalarDouble atan2** () const
  Arc tangent.
- **HxScalarDouble sinh** () const
  Hyperbolic sine.

- **HxScalarDouble cosh** () const
  Hyperbolic cosine.
- **HxScalarDouble tanh** () const
  Hyperbolic tangent.
- **HxScalarDouble exp** () const
  Exponent.
- **HxScalarDouble log** () const
  Natural logarithm.
- **HxScalarDouble log10** () const
  Base 10 logarithm.

Binary operations

Mathematical definition: **Binary operations on pixel values** (p. 5)

- HxScalarInt & **operator+=** (const HxScalarInt &v)
  Addition and assignment.
- HxScalarInt & **operator-=** (const HxScalarInt &v)
  Subtraction and assignment.
- HxScalarInt & **operator** $*$**=** (const HxScalarInt &v)
  Multiplication and assignment.
- HxScalarInt & **operator/=** (const HxScalarInt &v)
  Division and assignment.
- HxScalarInt **min** (const HxScalarInt &v) const
  Minimum.
- HxScalarInt & **minAssign** (const HxScalarInt &v)
  Minimum and assignment.
- HxScalarInt **max** (const HxScalarInt &v) const
  Maximum.
- HxScalarInt & **maxAssign** (const HxScalarInt &v)
  Maximum and assignment.
- HxScalarInt **inf** (const HxScalarInt &v) const
  Infimum.
- HxScalarInt & **infAssign** (const HxScalarInt &v)
  Infimum and assignment.

- HxScalarInt **sup** (const HxScalarInt &v) const
  Supremum.
- HxScalarInt & **supAssign** (const HxScalarInt &v)
  Supremum and assignment.
- HxScalarInt **pow** (const HxScalarInt &v) const
  Power.
- HxScalarInt **mod** (const HxScalarInt &v) const
  Modulo.
- HxScalarInt **and** (const HxScalarInt &v) const
  And.
- HxScalarInt **or** (const HxScalarInt &v) const
  Or.
- HxScalarInt **xor** (const HxScalarInt &v) const
  Xor.
- HxScalarInt **leftShift** (const HxScalarInt &v) const
  Left shift.
- HxScalarInt **rightShift** (const HxScalarInt &v) const
  Right shift.
- HxScalarInt **dot** (const HxScalarInt &v) const
  Dot product.
- HxScalarInt **cross** (const HxScalarInt &v) const
  Cross product.
- HxScalarInt **operator+** (const HxScalarInt &v1, const HxScalarInt &v2)
  Addition.
- HxScalarInt **operator-** (const HxScalarInt &v1, const HxScalarInt &v2)
  Subtraction.
- HxScalarInt **operator** $*$ (const HxScalarInt &v1, const HxScalarInt &v2)
  Multiplication.
- HxScalarInt **operator/** (const HxScalarInt &v1, const HxScalarInt &v2)
  Division.

Output

- STD_OSTREAM & **put** (STD_OSTREAM &os) const

  Print value on stream.

- **HxString toString** () const

  Value as a string.

Public Methods

- void * **operator new** (size_t, void *=0)

8.401.1 Detailed Description

Class definition scalar integer.

8.401.2 Constructor & Destructor Documentation

8.401.2.1 HxScalarInt::HxScalarInt () [inline]

Default constructor.

```
317 {
318 }
```

8.401.2.2 HxScalarInt::HxScalarInt (int *v*) [inline]

Conversion from native type.

```
322 {
323     _value = v;
324 }
```

8.401.2.3 HxScalarInt::HxScalarInt (const HxScalarInt & *v*) [inline]

Copy constructor.

```
328 {
329     _value = v._value;
330 }
```

8.401.3 Member Function Documentation

8.401.3.1 int HxScalarInt::dim () const [inline]

Dimensionality.

```
340 {
341     return 1;
342 }
```

8.401.3.2 int HxScalarInt::x () const [inline]

Value of (first) element.

```
346 {
347     return _value;
348 }
```

8.401.3.3 int HxScalarInt::getValue (int *dimension*) const [inline]

Element in given dimension.

```
352 {
353     return _value;
354 }
```

8.401.3.4 HxScalarInt::operator HxScalarDouble () const

Cast to **HxScalarDouble** (p. 1145).

```
26 {
27     return HxScalarDouble(_value);
28 }
```

8.401.3.5 HxScalarInt::operator HxVec2Int () const

Cast to **HxVec2Int** (p. 1281).

```
31 {
32     return HxVec2Int(_value, _value);
33 }
```

8.401.3.6 HxScalarInt::operator HxVec2Double () const

Cast to **HxVec2Double** (p. 1262).

```
36 {
37     return HxVec2Double(_value, _value);
38 }
```

8.401.3.7 HxScalarInt::operator HxVec3Int () const

Cast to **HxVec3Int** (p. 1321).

```
41 {
42     return HxVec3Int(_value, _value, _value);
43 }
```

8.401.3.8 HxScalarInt::operator HxVec3Double () const

Cast to **HxVec3Double** (p. 1301).

```
46 {
47     return HxVec3Double(_value, _value, _value);
48 }
```

8.401.3.9 HxScalarInt::operator HxComplex () const

Cast to **HxComplex** (p. 506).

```
51 {
52     return HxComplex(_value, 0.0);
53 }
```

8.401.3.10 int HxScalarInt::operator== (const HxScalarInt & *v*) const [inline]

Equal.

```
370 {
371     return (_value == v._value);
372 }
```

8.401.3.11 int HxScalarInt::operator!= (const HxScalarInt & *v*) const [inline]

Not equal.

```
376 {
377     return (_value != v._value);
378 }
```

8.401.3.12 int HxScalarInt::operator< (const HxScalarInt & *v*) const [inline]

Less than.

```
382 {
383     return (_value < v._value);
384 }
```

8.401.3.13 int HxScalarInt::operator<= (const HxScalarInt & *v*) const [inline]

Less equal.

```
388 {
389     return (_value <= v._value);
390 }
```

8.401.3.14 int HxScalarInt::operator> (const HxScalarInt & *v*) const [inline]

Greater than.

```
394 {
395     return (_value > v._value);
396 }
```

8.401.3.15 int HxScalarInt::operator>= (const HxScalarInt & *v*) const [inline]

Greater equal.

```
400 {
401     return (_value >= v._value);
402 }
```

8.401.3.16 HxScalarInt HxScalarInt::operator- () const [inline]

Negation.

```
406 {
407     return HxScalarInt(-_value);
408 }
```

8.401.3.17 HxScalarInt HxScalarInt::complement () const [inline]

Complement.

```
412 {
413     return HxScalarInt(~_value);
414 }
```

8.401.3.18 HxScalarInt HxScalarInt::abs () const [inline]

Absolute value.

```
418 {
419     return HxScalarInt(::abs(_value));
420 }
```

8.401.3.19 HxScalarInt HxScalarInt::ceil () const [inline]

Ceiling.

```
424 {
425     return *this;
426 }
```

8.401.3.20 HxScalarInt HxScalarInt::floor () const [inline]

Floor.

```
430 {
431     return *this;
432 }
```

8.401.3.21 HxScalarInt HxScalarInt::round () const [inline]

Round.

```
436 {
437     return *this;
438 }
```

8.401.3.22 HxScalarInt HxScalarInt::sum () const [inline]

Sum.

```
442 {
443     return *this;
444 }
```

8.401.3.23 HxScalarInt HxScalarInt::product () const [inline]

Product.

```
448 {
449     return *this;
450 }
```

8.401.3.24 HxScalarInt HxScalarInt::min () const [inline]

Minimum.

```
454 {
455     return *this;
456 }
```

8.401.3.25 HxScalarInt HxScalarInt::max () const [inline]

Maximum.

```
460 {
461     return *this;
462 }
```

8.401.3.26 HxScalarInt HxScalarInt::norm1 () const [inline]

L1 norm.

```
466 {

618 }
```

8.401.3.61 HxScalarInt HxScalarInt::rightShift (const HxScalarInt & *v*) const [inline]

Right shift.

```
622 {
623     return HxScalarInt(_value >> v._value);
624 }
```

8.401.3.62 HxScalarInt HxScalarInt::dot (const HxScalarInt & *v*) const

Dot product.

```
147 {
148     return _value * v._value;
149 }
```

8.401.3.63 HxScalarInt HxScalarInt::cross (const HxScalarInt & *v*) const [inline]

Cross product.

```
628 {
629     return 0;
630 }
```

8.401.3.64 STD_OSTREAM & HxScalarInt::put (STD_OSTREAM & *os*) const

Print value on stream.

For global operator<<

```
153 {
154     return os << _value;
155 }
```

8.401.3.65 HxString HxScalarInt::toString () const [inline]

Value as a string.

```
634 {
635     return makeString(_value);
636 }
```

8.401.4 Friends And Related Function Documentation

8.401.4.1 HxScalarInt operator+ (const HxScalarInt & *v1*, const HxScalarInt & *v2*) [friend]

Addition.

```
506 {
507     return HxScalarInt(v1._value + v2._value);
508 }
```

8.401.4.2 HxScalarInt operator- (const HxScalarInt & *v1*, const HxScalarInt & *v2*) [friend]

Subtraction.

```
512 {
513     return HxScalarInt(v1._value - v2._value);
514 }
```

8.401.4.3 HxScalarInt operator * (const HxScalarInt & *v1*, const HxScalarInt & *v2*) [friend]

Multiplication.

```
518 {
519     return HxScalarInt(v1._value * v2._value);
520 }
```

8.401.4.4 HxScalarInt operator/ (const HxScalarInt & *v1*, const HxScalarInt & *v2*) [friend]

Division.

```
524 {
525     return HxScalarInt(v1._value / v2._value);
526 }
```

8.401.5 Member Data Documentation

8.401.5.1 const HxScalarInt HxScalarInt::SMALL_VAL = -200000000 [static]

A small value w.r.t to the comparison operators "<" and ">".

Not actually the minimum to avoid overflow.

8.401.5.2 const HxScalarInt HxScalarInt::LARGE_VAL = 200000000 [static]

A large value w.r.t to the comparison operators "<" and ">".

Not actually the maximum to avoid overflow.

The documentation for this class was generated from the following files:

- **HxScalarInt.h**
- HxScalarInt.c

8.402 HxSegmentation2d Class Reference

A segmentation of a 2D image.

`#include <HxSegmentation2d.h>`

Public Methods

- **HxSegmentation2d** ()
  Constructor.
- **HxSegmentation2d** (**HxImageRep** inputIm, **HxImageRep** labIm)
  Constructor.
- ∼**HxSegmentation2d** ()
  Destructor.
- int **ident** () const
  The identifier of this segmentation.
- void **setInputImage** (**HxImageRep** inputIm)
  Set the orginal image.
- **HxImageRep getInputImage** () const
  Get the orginal image.
- void **setLabeledImage** (**HxImageRep** labIm)
  Set the labeled image.
- **HxImageRep getLabeledImage** () const
  Get the labeled image.
- void **addBlob** (**HxBlob2d** ∗blob)
  Add a blob to the segmentation.
- void **addBlob** (int label, int xmin, int ymin, int width, int height)
  Add a blob to the segmentation.
- **HxBlob2dListConstIter getBlobBegin** () const

Get begin of the blob list.

- **HxBlob2dListConstIter getBlobEnd** () const

  Get end (STL term) of the blob list.

- **HxBlob2dListBackInserter getBlobInserter** ()

  Get a backinserter for the blob list.

- void **addRelation** (**HxString** name, **HxBlob2dRelation** ∗rel)

  Add a relation to the segmentation.

- **HxBlob2dRelation** ∗ **getRelation** (**HxString** name) const

  Get a relation from the segmentation.

- STD_OSTREAM & **put** (STD_OSTREAM &os) const

  Put segmentation on stream.

8.402.1 Detailed Description

A segmentation of a 2D image.

Basically, a list of **HxBlob2d** (p. 402)'s, possibly with relationships.

8.402.2 Constructor & Destructor Documentation

8.402.2.1 HxSegmentation2d::HxSegmentation2d ()

Constructor.

```
17 {
18     _ident = _nr++;
19 }
```

8.402.2.2 HxSegmentation2d::HxSegmentation2d (HxImageRep *inputIm*, HxImageRep *labIm*)

Constructor.

```
22 {
23     _inputImage = inputIm;
24     _labImage = labIm;
25     _ident = _nr++;
26 }
```

8.402.2.3 HxSegmentation2d::∼HxSegmentation2d ()

Destructor.

```
29 {
30     for(int i=0 ; i<_blobs.size() ; i++)
31         delete _blobs[i];
32     _blobs.clear();
33 }
```

8.402.3 Member Function Documentation

8.402.3.1 int HxSegmentation2d::ident () const

The identifier of this segmentation.

```
37 {
38     return _ident;
39 }
```

8.402.3.2 void HxSegmentation2d::setInputImage (HxImageRep *inputIm*)

Set the orginal image.

```
43 {
44     _inputImage = inputIm;
45 }
```

8.402.3.3 HxImageRep HxSegmentation2d::getInputImage () const

Get the orginal image.

```
49 {
50     return _inputImage;
51 }
```

8.402.3.4 void HxSegmentation2d::setLabeledImage (HxImageRep *labIm*)

Set the labeled image.

```
55 {
56     _labImage = labIm;
57 }
```

8.402.3.5 HxImageRep HxSegmentation2d::getLabeledImage () const

Get the labeled image.

```
61 {
62     return _labImage;
63 }
```

8.402.3.6 void HxSegmentation2d::addBlob (HxBlob2d * *blob*)

Add a blob to the segmentation.

Will take ownership of the blob.

```
67 {
68     _blobs.push_back(blob);
69 }
```

8.402.3.7 void HxSegmentation2d::addBlob (int *label*, int *xmin*, int *ymin*, int *width*, int *height*)

Add a blob to the segmentation.

```
73 {
74     HxBlob2d* blob = new HxBlob2d(label, xmin, ymin, width, height);
75     _blobs.push_back(blob);
76 }
```

8.402.3.8 HxBlob2dListConstIter HxSegmentation2d::getBlobBegin () const

Get begin of the blob list.

```
80 {
81     return _blobs.begin();
82 }
```

8.402.3.9 HxBlob2dListConstIter HxSegmentation2d::getBlobEnd () const

Get end (STL term) of the blob list.

```
86 {
87     return _blobs.end();
88 }
```

8.402.3.10 HxBlob2dListBackInserter HxSegmentation2d::getBlobInserter ()

Get a backinserter for the blob list.

```
92 {
93     return std::back_inserter(_blobs);
94 }
```

8.402.3.11 void HxSegmentation2d::addRelation (HxString *name*, HxBlob2dRelation * *rel*)

Add a relation to the segmentation.

Will take ownership of the relation.

```
98 {
99     _relations[name] = rel;
100 }
```

8.402.3.12 HxBlob2dRelation * HxSegmentation2d::getRelation (HxString *name*) const

Get a relation from the segmentation.

```
104 {
105     return (*_relations.find(name)).second;
106 }
```

8.402.3.13 STD_OSTREAM & HxSegmentation2d::put (STD_OSTREAM & *os*) const

Put segmentation on stream.

```
110 {
111     os << "Segmentation " << _ident << ", nr of blobs : " << _blobs.size()
112        << STD_ENDL;
113     for (int i=0 ; i<_blobs.size() ; i++)
114         os << (*_blobs[i]);
115     return os;
116 }
```

The documentation for this class was generated from the following files:

8.403.1 Detailed Description

Class definition of the structuring function used for Mathematical Morphology operations.

Author:
Leon Todoran (`todoran@science.uva.nl`)

Version:
0.1

Date:
10.01.2002

the structuring element should have the same signature as the argument image

Remarks:
is it allowed for the se to have:

- even size?
- different x and y sizes?
- different signature than the image?

Todo:
still have to implement: -roatation of se

8.403.2 Constructor & Destructor Documentation

8.403.2.1 HxSF::HxSF ()

Null Structuring Function.

```
18 {
19     symetric        = false;
20     separable       = false;
21     connectivity    = 8;
22 }
```

8.403.2.2 HxSF::HxSF (const HxSF & *a*)

Copy Constructor.

```
26 {
27     se              = a.getKernel();
28     seH             = a.getHorizontalKernel();
29     seV             = a.getVerticalKernel();
30     symetric        = a.isSymetric();
31     separable       = a.isSeparable();
32     connectivity    = a.getConnectivity();
33 }
```

8.403.3 Member Function Documentation

8.403.3.1 HxSF & HxSF::operator= (const HxSF & *a*)

Assignment operator.

```
73 {
74     se              = a.getKernel();
75     seH             = a.getHorizontalKernel();
76     seV             = a.getVerticalKernel();
77     symetric        = a.isSymetric();
78     separable       = a.isSeparable();
79     connectivity    = a.getConnectivity();
80
81     return *this;
82 }
```

8.403.3.2 HxSF HxSF::dilateSF (int *n*)

perform a ”n-1” dilation or Minkowski addition of the SF.

```
111 {
112     if(n==0)
113         return *this;
114
115     size = se.sizes();
116     int increaseFactorX = size.x()/2;
117     int increaseFactorY = size.y()/2;
118     int newx = size.x()+2*n*increaseFactorX;
```

```
119     int newy = size.y()+2*n*increaseFactorY;
120     HxSizes sz(newx,newy,1);
121     HxPoint p(newx/2-size.x()/2,newy/2-(size.y())/2,0);
122
123     HxImageRep im = HxExtendVal(se,sz,0,p);
124
125     for(int i=0; i< n; i++)
126         im = HxDilation(im, *this);
127
128
129     HxSF sf(im, this->isSymetric(), false, this->getConnectivity() );
130
131     return sf;
132 }
```

8.403.3.3 HxSF HxSF::rotateSF (int *theta*, bool *sense*)

perform rotation of the SF; this is used in Thickening and Thinning the allowed values for theta are 45, 90, 180 sense is TRUE for COUNTERCLOCKWISE and FALSE for CLOCKWISE.

Version:
0.1

8.404.2 Member Function Documentation

8.404.2.1 HxSFFactory & HxSFFactory::instance () [static]

The one and only instance of this class.

```
9 {
10     static HxSFFactory theFactory;
11     return theFactory;
12 }
```

8.404.2.2 HxSF HxSFFactory::makeSFfromImage (HxImageRep *kernel*)

New Structuring Function from a given image.

```
16 {
17      return HxSF(kernel, false, false, 8);
18 }
```

8.404.2.3 HxSF HxSFFactory::fromFunction (HxImageRep *im*)

New Structuring Function from a given function.

For instance, one can specify a Gaussian function here From the given function, the actuall image repesentation will be computed

8.404.2.4 HxSF HxSFFactory::makeFlatSF (HxImageSignature *sig*, HxSizes *sz*, HxValue *val* = 0)

New Flat Structuring Function of a given signature, size, and pixel value.

```
22 {
23     HxImageRep kernel = HxImageFactory::instance().fromValue(sig, sz, val);
24
25     //this is separable, so create the H and V kernels
26     HxSizes szV(sz.y(), 1, sz.z());
27     HxSizes szH(sz.x(), 1, sz.z());
28     HxImageRep hKernel = HxMakeFromValue(sig, szH, val);
29     HxImageRep vKernel = HxMakeFromValue(sig, szV, val);
30
31
32      return HxSF(kernel, hKernel, vKernel, true, true, 8);
33 }
```

The documentation for this class was generated from the following files:

- HxSFFactory.c

8.405 HxStringList Class Reference

Class definition for list of HxString's.

`#include <HxStringList.h>`

Public Types

- typedef std::back_insert_iterator< HxStringList > **back_insert_iterator**

  back inserter.

Public Methods

- **HxStringList** ()
- **HxStringList** (const std::list< std::string > &l)
- **HxStringList** (const std::vector< std::string > &l)
- HxStringList & **operator**<< (const **HxString** &)

  Add string to the list.

- void **eraseAll** ()

  Remove all value from the list.

8.405.1 Detailed Description

Class definition for list of HxString's.

Specialization of list from STL.

8.405.2 Member Typedef Documentation

8.405.2.1 typedef std::back_insert_iterator<HxStringList> HxStringList::back_insert_iterator

back inserter.

8.405.3 Member Function Documentation

8.405.3.1 HxStringList & HxStringList::operator<< (const HxString & *s*) [inline]

Add string to the list.

```
52 {
53     push_back(s);
54     return *this;
55 }
```

8.405.3.2 void HxStringList::eraseAll () [inline]

Remove all value from the list.

```
59 {
60     erase(begin(), end());
61 }
```

The documentation for this class was generated from the following file:

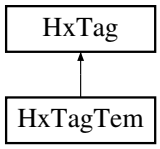
- **HxStringList.h**

8.406 HxTag Class Reference

Base class for tags.

`#include <HxTag.h>`

Inheritance diagram for HxTag::



Public Methods

- **HxTag** (**HxString** name)
  Constructor.
- virtual ~**HxTag** ()

Destructor.

- virtual HxTag * **clone** () const=0
  Clone operation.
- **HxString getName** () const
  Get the name of this tag.
- virtual std::ostream & **put** (std::ostream &) const=0
  To put the tag on an ostream.

Protected Methods

- **HxTag** (const HxTag &)
  Copy constructor.

8.406.1 Detailed Description

Base class for tags.

8.406.2 Constructor & Destructor Documentation

8.406.2.1 HxTag::HxTag (HxString *name*) [inline]

Constructor.

```
65     : _name(name)
66 {
67 }
```

8.406.2.2 HxTag::~HxTag () [virtual]

Destructor.

```
18 {
19 #ifdef CD_TRACE
20     HxEnvironment::instance()->outputStream()
21         << "HxTag::~HxTag()" << STD_ENDL;
22     HxEnvironment::instance()->flush();
23 #endif
24 }
```

8.406.2.3 HxTag::HxTag (const HxTag & *rhs*) [inline, protected]

Copy constructor.

```
59     : _name(rhs._name)
60 {
61 }
```

8.406.3 Member Function Documentation

8.406.3.1 virtual HxTag* HxTag::clone () const [pure virtual]

Clone operation.

Reimplemented in **HxTagTem** (p. 1203).

8.406.3.2 HxString HxTag::getName () const [inline]

Get the name of this tag.

```
71 {
72     return _name;
73 }
```

8.406.3.3 virtual std::ostream& HxTag::put (std::ostream & *os*) const [pure virtual]

To put the tag on an ostream.

Reimplemented in **HxTagTem** (p. 1204).

The documentation for this class was generated from the following files:

- **HxTag.h**
- HxTag.c

8.407 HxTag1Phase Struct Reference

1 phase pixel operation.

`#include <HxCategories.h>`

Public Methods

- **HxString toString** ()
  Convert tag to string.

8.407.1 Detailed Description

1 phase pixel operation.

8.407.2 Member Function Documentation

8.407.2.1 HxString HxTag1Phase::toString () [inline]

Convert tag to string.

```
25 { return "1 phase"; }
```

The documentation for this struct was generated from the following file:

- **HxCategories.h**

8.408 HxTag2Phase Struct Reference

2 phase pixel operation.

`#include <HxCategories.h>`

Public Methods

- **HxString toString** ()
  Convert tag to string.

8.408.1 Detailed Description

2 phase pixel operation.

8.408.2 Member Function Documentation

8.408.2.1 HxString HxTag2Phase::toString () [inline]

Convert tag to string.

```
31 { return "2 phase"; }
```

The documentation for this struct was generated from the following file:

- **HxCategories.h**

8.409 HxTagCnum Struct Reference

Coordinate enumerated neighbourhood iterator.

`#include <HxCategories.h>`

Public Methods

- **HxString toString** ()
  Convert tag to string.

8.409.1 Detailed Description

Coordinate enumerated neighbourhood iterator.

8.409.2 Member Function Documentation

8.409.2.1 HxString HxTagCnum::toString () [inline]

Convert tag to string.

```
76 { return "Coordinate enumerated"; }
```

The documentation for this struct was generated from the following file:

- **HxCategories.h**

8.410 HxTagList Class Reference

A list of tags.

`#include <HxTagList.h>`

Public Types

- typedef **HxTag** * **TagPtr**
  Type definition for a pointer to an **HxTag** (p. 1192).
- typedef std::list< **TagPtr** > **List**
  Type definition for a list of tag pointers.

Public Methods

- **HxTagList** ()
  Constructor.
- **HxTagList** (const HxTagList &)
  Copy constructor.
- ~**HxTagList** ()
  Destructor.
- HxTagList & **operator=** (const HxTagList &)
  Assignment operator.
- void **erase** ()
  Make the tag list empty.
- void **addTag** (**HxTag** *)
  Add a tag, use via **HxAddTag** (p. 366).
- **HxTag** * **getTag** (**HxString** name) const
  Get a tag, use via **HxGetTag** (p. 366).

- **HxString toString** () const

  Make a sttring with names of all tags.

- std::ostream & **put** (std::ostream &) const

  To put the list on an ostream.

8.410.1 Detailed Description

A list of tags.

Basically, a tag is a combination of a name and a value. The name is represented by an HxString and the value is represented by an instantiation of **HxTagTem** (p. 1202), which is a specialization of **HxTag** (p. 1192). A value can be anything as long as it can be copy-constructed.

Use **HxAddTag** (p. 366) to add tags to the list. Use **HxGetTag**(const HxTagList&,HxString) (p. 366) and **HxGetTag**(const HxTagList&,HxString,ValT) (p. 366) to obtain values stored in the list. Use **HxTagIsSet** (p. 366) to check whether a tag is in the list.

8.410.2 Member Typedef Documentation

8.410.2.1 typedef HxTag* HxTagList::TagPtr

Type definition for a pointer to an **HxTag** (p. 1192).

8.410.2.2 typedef std::list<TagPtr> HxTagList::List

Type definition for a list of tag pointers.

8.410.3 Constructor & Destructor Documentation

8.410.3.1 HxTagList::HxTagList () [inline]

Constructor.

```
38 {}
```

8.410.3.2 HxTagList::HxTagList (const HxTagList & *rhs*)

Copy constructor.

```
16 {
17     List::const_iterator ptr;
18     for (ptr = rhs._list.begin(); ptr != rhs._list.end(); ptr++)
19     {
20         _list.push_back((*ptr)->clone());
21     }
22 }
```

8.410.3.3 HxTagList::~HxTagList ()

Destructor.

```
39 {
40     List::iterator ptr;
41
42     for (ptr = _list.begin(); ptr != _list.end(); ptr++)
43         delete (*ptr);
44 }
```

8.410.4 Member Function Documentation

8.410.4.1 HxTagList & HxTagList::operator= (const HxTagList & *rhs*)

Assignment operator.

```
26 {
27     List::const_iterator ptr;
28     for (ptr = _list.begin(); ptr != _list.end(); ptr++)
29         delete (*ptr);
30     _list.erase(_list.begin(), _list.end());
31     for (ptr = rhs._list.begin(); ptr != rhs._list.end(); ptr++)
32     {
33         _list.push_back((*ptr)->clone());
34     }
35     return *this;
36 }
```

8.410.4.2 void HxTagList::erase ()

Make the tag list empty.

```
48 {
49     List::const_iterator ptr;
50     for (ptr = _list.begin(); ptr != _list.end(); ptr++)
51         delete (*ptr);
52     _list.erase(_list.begin(), _list.end());
53 }
```

8.410.4.3 void HxTagList::addTag (HxTag * *tag*)

Add a tag, use via **HxAddTag** (p. 366).

```
77 {
78     List::iterator ptr = findTag(tag->getName());
79
80     if (ptr != _list.end() )
81     {
82         delete (*ptr);
83         _list.erase(ptr);
84     }
85     _list.push_front(tag);
86 }
```

8.410.4.4 HxTag * HxTagList::getTag (HxString *name*) const

Get a tag, use via **HxGetTag** (p. 366).

```
90 {
91     List::const_iterator ptr = findTag(name);
92     return ptr != _list.end() ? (*ptr) : 0;
93 }
```

8.410.4.5 HxString HxTagList::toString () const

Make a sttring with names of all tags.

```
97 {
98     int i = 0;
99     HxString s("(");
100     List::const_iterator ptr;
101     for (ptr = _list.begin(); ptr != _list.end(); ptr++)
102     {
103         if (i > 0)
104             s += ", ";
105         s += (*ptr)->getName();
106 
107     }
108     s += ")";
109     return s;
110 }
```

8.410.4.6 std::ostream & HxTagList::put (std::ostream & *os*) const

To put the list on an ostream.

```
114 {
115     List::const_iterator ptr;
116     for (ptr = _list.begin(); ptr != _list.end(); ptr++)
117         os << (*ptr) << STD_ENDL;
118     return os;
119 }
```

8.434 HxUpoMax Class Template Reference

Pixel functor for computation of maximum.

`#include <HxUpoMax.h>`

Public Types

- typedef **HxTagTransInVar TransVarianceCategory**
  Functor is translation invariant.

Public Methods

- **HxUpoMax** (**HxTagList** &)
  Constructor : empty.
- DstValT **doIt** (const SrcValT &x)
  Actual operation : # return x.max() #.

Static Public Methods

- **HxString className** ()
  The name : ”max”.

8.434.1 Detailed Description

template<class DstValT, class SrcValT> class HxUpoMax< DstValT, SrcValT >

Pixel functor for computation of maximum.

8.434.2 Member Typedef Documentation

8.434.2.1 template<class DstValT, class SrcValT> typedef HxTagTransInVar HxUpoMax::TransVarianceCategory

Functor is translation invariant.

8.434.3 Constructor & Destructor Documentation

8.434.3.1 template<class DstValT, class SrcValT> HxUpoMax< DstValT, SrcValT >::HxUpoMax (HxTagList &) [inline]

Constructor : empty.

```
29                          {}
```

8.434.4 Member Function Documentation

8.434.4.1 template<class DstValT, class SrcValT> DstValT HxUpoMax< DstValT, SrcValT >::doIt (const SrcValT & *x*) [inline]

Actual operation : # return x.max() #.

```
33                          { return x.max(); }
```

8.434.4.2 template<class DstValT, class SrcValT> HxString HxUpoMax< DstValT, SrcValT >::className () [inline, static]

The name : ”max”.

```
37                          { return HxString("max"); }
```

The documentation for this class was generated from the following file:

- **HxUpoMax.h**

8.435 HxUpoMin Class Template Reference

Pixel functor for computation of minimum.

`#include <HxUpoMin.h>`

Public Types

- typedef **HxTagTransInVar TransVarianceCategory**

  Functor is translation invariant.

Public Methods

- **HxUpoMin** (**HxTagList** &)
  Constructor : empty.
- DstValT **doIt** (const SrcValT &x)
  Actual operation : # return x.min() #.

Static Public Methods

- **HxString className** ()
  The name : "min".

8.435.1 Detailed Description

template<class DstValT, class SrcValT> class HxUpoMin< DstValT, SrcValT >

Pixel functor for computation of minimum.

8.435.2 Member Typedef Documentation

8.435.2.1 template<class DstValT, class SrcValT> typedef HxTagTransInVar HxUpoMin::TransVarianceCategory

Functor is translation invariant.

8.435.3 Constructor & Destructor Documentation

8.435.3.1 template<class DstValT, class SrcValT> HxUpoMin< DstValT, SrcValT >::HxUpoMin (HxTagList &) [inline]

Constructor : empty.

```
29                          {}
```

8.435.4 Member Function Documentation

8.435.4.1 template<class DstValT, class SrcValT> DstValT HxUpoMin< DstValT, SrcValT >::doIt (const SrcValT & *x*) [inline]

Actual operation : # return x.min() #.

```
33                          { return x.min(); }
```

8.435.4.2 template<class DstValT, class SrcValT> HxString HxUpoMin< DstValT, SrcValT >::className () [inline, static]

The name : ”min”.

```
37                          { return HxString("min"); }
```

The documentation for this class was generated from the following file:

- **HxUpoMin.h**

8.436 HxUpoNegate Class Template Reference

Pixel functor for computation of negation.

`#include <HxUpoNegate.h>`

Public Types

- typedef **HxTagTransInVar TransVarianceCategory**
  Functor is translation invariant.

Public Methods

- **HxUpoNegate** (**HxTagList** &)
  Constructor : empty.
- DstValT **doIt** (const SrcValT &x)
  Actual operation : # return -x #.

Static Public Methods

- **HxString className** ()
  The name : ”negate”.

8.436.1 Detailed Description

template<class DstValT, class SrcValT> class HxUpoNegate< DstValT, SrcValT >

Pixel functor for computation of negation.

8.436.2 Member Typedef Documentation

8.436.2.1 template<class DstValT, class SrcValT> typedef HxTagTransInVar HxUpoNegate::TransVarianceCategory

Functor is translation invariant.

8.436.3 Constructor & Destructor Documentation

8.436.3.1 template<class DstValT, class SrcValT> HxUpoNegate< DstValT, SrcValT >::HxUpoNegate (HxTagList &) [inline]

Constructor : empty.

```
29                          {}
```

8.436.4 Member Function Documentation

8.436.4.1 template<class DstValT, class SrcValT> DstValT HxUpoNegate< DstValT, SrcValT >::doIt (const SrcValT & *x*) [inline]

Actual operation : # return -x #.

```
33                          { return -x; }
```

8.436.4.2 template<class DstValT, class SrcValT> HxString HxUpoNegate< DstValT, SrcValT >::className () [inline, static]

The name : ”negate”.

```
37                          { return HxString("negate"); }
```

The documentation for this class was generated from the following file:

- **HxUpoNegate.h**

8.437 HxUpoNorm1 Class Template Reference

Pixel functor for computation of L1 norm.

`#include <HxUpoNorm1.h>`

Public Types

- typedef **HxTagTransInVar TransVarianceCategory**

  Functor is translation invariant.

Public Methods

- **HxUpoNorm1** (**HxTagList** &)
  Constructor : empty.
- DstValT **doIt** (const SrcValT &x)
  Actual operation : # return x.norm1() #.

Static Public Methods

- **HxString className** ()
  The name : "norm1".

8.437.1 Detailed Description

template<class DstValT, class SrcValT> class HxUpoNorm1< DstValT, SrcValT >

Pixel functor for computation of L1 norm.

8.437.2 Member Typedef Documentation

8.437.2.1 template<class DstValT, class SrcValT> typedef HxTagTransInVar HxUpoNorm1::TransVarianceCategory

Functor is translation invariant.

8.437.3 Constructor & Destructor Documentation

8.437.3.1 template<class DstValT, class SrcValT> HxUpoNorm1< DstValT, SrcValT >::HxUpoNorm1 (HxTagList &) [inline]

Constructor : empty.

```
29                          {}
```

8.437.4 Member Function Documentation

8.437.4.1 template<class DstValT, class SrcValT> DstValT HxUpoNorm1< DstValT, SrcValT >::doIt (const SrcValT & *x*) [inline]

Actual operation : # return x.norm1() #.

```
33                          { return x.norm1(); }
```

8.437.4.2 template<class DstValT, class SrcValT> HxString HxUpoNorm1< DstValT, SrcValT >::className () [inline, static]

The name : ”norm1”.

```
37                          { return HxString("norm1"); }
```

The documentation for this class was generated from the following file:

- **HxUpoNorm1.h**

8.438 HxUpoNorm2 Class Template Reference

Pixel functor for computation of L2 norm.

`#include <HxUpoNorm2.h>`

Public Types

- typedef **HxTagTransInVar TransVarianceCategory**
  Functor is translation invariant.

Public Methods

- **HxUpoNorm2** (**HxTagList** &)
  Constructor : empty.
- DstValT **doIt** (const SrcValT &x)
  Actual operation : # return x.norm2() #.

Static Public Methods

- **HxString className** ()
  The name : ”norm2”.

8.438.1 Detailed Description

template<class DstValT, class SrcValT> class HxUpoNorm2< DstValT, SrcValT >

Pixel functor for computation of L2 norm.

8.438.2 Member Typedef Documentation

8.438.2.1 template<class DstValT, class SrcValT> typedef HxTagTransInVar HxUpoNorm2::TransVarianceCategory

Functor is translation invariant.

8.438.3 Constructor & Destructor Documentation

8.438.3.1 template<class DstValT, class SrcValT> HxUpoNorm2< DstValT, SrcValT >::HxUpoNorm2 (HxTagList &) [inline]

Constructor : empty.

```
29                          {}
```

8.438.4 Member Function Documentation

8.438.4.1 template<class DstValT, class SrcValT> DstValT HxUpoNorm2< DstValT, SrcValT >::doIt (const SrcValT & *x*) [inline]

Actual operation : # return x.norm2() #.

```
33                          { return x.norm2(); }
```

8.438.4.2 template<class DstValT, class SrcValT> HxString HxUpoNorm2< DstValT, SrcValT >::className () [inline, static]

The name : ”norm2”.

```
37                          { return HxString("norm2"); }
```

The documentation for this class was generated from the following file:

- **HxUpoNorm2.h**

8.439 HxUpoNorm2Sqr Class Template Reference

Pixel functor for computation of squared L2 norm.

`#include <HxUpoNorm2Sqr.h>`

Public Types

- typedef **HxTagTransInVar TransVarianceCategory**

  Functor is translation invariant.

Public Methods

- **HxUpoNorm2Sqr** (**HxTagList** &)
  Constructor : empty.
- DstValT **doIt** (const SrcValT &x)
  Actual operation : # return (x∗x).sum() #.

Static Public Methods

- **HxString className** ()
  The name : "norm2sqr".

8.439.1 Detailed Description

template<class DstValT, class SrcValT> class HxUpoNorm2Sqr< DstValT, SrcValT >

Pixel functor for computation of squared L2 norm.

8.439.2 Member Typedef Documentation

8.439.2.1 template<class DstValT, class SrcValT> typedef HxTagTransInVar HxUpoNorm2Sqr::TransVarianceCategory

Functor is translation invariant.

8.439.3 Constructor & Destructor Documentation

8.439.3.1 template<class DstValT, class SrcValT> HxUpoNorm2Sqr< DstValT, SrcValT >::HxUpoNorm2Sqr (HxTagList &) [inline]

Constructor : empty.

```
29                          {}
```

8.439.4 Member Function Documentation

8.439.4.1 template<class DstValT, class SrcValT> DstValT HxUpoNorm2Sqr< DstValT, SrcValT >::doIt (const SrcValT & *x*) [inline]

Actual operation : # return (x∗x).sum() #.

```
33                          { return (x*x).sum(); }
```

8.439.4.2 template<class DstValT, class SrcValT> HxString HxUpoNorm2Sqr< DstValT, SrcValT >::className () [inline, static]

The name : ”norm2sqr”.

```
37                          { return HxString("norm2sqr"); }
```

The documentation for this class was generated from the following file:

- **HxUpoNorm2Sqr.h**

8.440 HxUpoNormInf Class Template Reference

Pixel functor for computation of L inf norm.

`#include <HxUpoNormInf.h>`

Public Types

- typedef **HxTagTransInVar TransVarianceCategory**
  Functor is translation invariant.

Public Methods

- **HxUpoNormInf** (**HxTagList** &)
  Constructor : empty.
- DstValT **doIt** (const SrcValT &x)
  Actual operation : # return x.normInf() #.

Static Public Methods

- **HxString className** ()
  The name : ”normInf”.

8.440.1 Detailed Description

template<class DstValT, class SrcValT> class HxUpoNormInf< DstValT, SrcValT >

Pixel functor for computation of L inf norm.

8.440.2 Member Typedef Documentation

8.440.2.1 template<class DstValT, class SrcValT> typedef HxTagTransInVar HxUpoNormInf::TransVarianceCategory

Functor is translation invariant.

8.440.3 Constructor & Destructor Documentation

8.440.3.1 template<class DstValT, class SrcValT> HxUpoNormInf< DstValT, SrcValT >::HxUpoNormInf (HxTagList &) [inline]

Constructor : empty.

```
29                          {}
```

8.440.4 Member Function Documentation

8.440.4.1 template<class DstValT, class SrcValT> DstValT HxUpoNormInf< DstValT, SrcValT >::doIt (const SrcValT & *x*) [inline]

Actual operation : # return x.normInf() #.

```

  The arithmetic data types that may be stored.

Public Methods

- **HxString toString** () const

Friends

- STD_OSTREAM & **operator**<< (STD_OSTREAM &os, const HxValue val)

8.450.1 Detailed Description

Class definition of a value as used in Horus.

An HxValue is capable of storing each of the arithmetic data types. HxValue is used to pass arbitrary values using a single function interface. HxValue is not meant to do arithmetic on arbitrary values and hence no such operations are defined in the interface.

8.450.2 Member Enumeration Documentation

8.450.2.1 enum HxValue::Tag

The arithmetic data types that may be stored.

SI: scalar integer, SD: scalar double, V2I: vector of 2 integers, V2D: vector of 2 doubles, V3I: vector of 3 integers, V3D: vector of 3 doubles. CPL: complex number (2 doubles).

```
42 { SI, SD, V2I, V2D, V3I, V3D, CPL };
```

8.450.3 Constructor & Destructor Documentation

8.450.3.1 HxValue::HxValue (int *v* = 0) [inline]

Construction from native integer.

```
159 {
160     _tag._tag = SI;
161     new(&_val[0]) HxScalarInt(v);
162 }
```

8.450.3.2 HxValue::HxValue (double *v*) [inline]

Construction from native double.

```
166 {
167     _tag._tag = SD;
168     new(&_val[0]) HxScalarDouble(v);
169 }
```

8.450.3.3 HxValue::HxValue (HxScalarInt *v*) [inline]

Construction from scalar integer.

```
173 {
174     _tag._tag = SI;
175     new(&_val[0]) HxScalarInt(v);
176 }
```

8.450.3.4 HxValue::HxValue (HxScalarDouble *v*) [inline]

Construction from scalar double.

```
180 {
181     _tag._tag = SD;
182     new(&_val[0]) HxScalarDouble(v);
183 }
```

8.450.3.5 HxValue::HxValue (HxVec2Int *v*) [inline]

Construction from vector of 2 integers.

```
187 {
188     _tag._tag = V2I;
189     new(&_val[0]) HxVec2Int(v);
190 }
```

8.450.3.6 HxValue::HxValue (HxVec2Double *v*) [inline]

Construction from vector of 2 doubles.

```
194 {
195     _tag._tag = V2D;
196     new(&_val[0]) HxVec2Double(v);
197 }
```

8.450.3.7 HxValue::HxValue (HxVec3Int *v*) [inline]

Construction from vector of 3 integers.

```
201 {
202     _tag._tag = V3I;
203     new(&_val[0]) HxVec3Int(v);
204 }
```

8.450.3.8 HxValue::HxValue (HxVec3Double *v*) [inline]

Construction from vector of 3 doubles.

```
208 {
209     _tag._tag = V3D;
210     new(&_val[0]) HxVec3Double(v);
211 }
```

8.450.3.9 HxValue::HxValue (HxComplex *v*) [inline]

Construction from complex.

```
215 {
216     _tag._tag = CPL;
217     new(&_val[0]) HxComplex(v);
218 }
```

8.450.4 Member Function Documentation

8.450.4.1 HxValue::Tag HxValue::tag () const [inline]

The type of the value stored.

```
222 {
223     return _tag._tag;
224 }
```

8.450.4.2 HxScalarInt & HxValue::HxScalarIntValue () [inline]

  Copy constructor.

Inquiry

- int **dim** () const
  Dimensionality.
- double **x** () const
  Value of first element.
- double **y** () const
  Value of second element.
- double **getValue** (int dimension) const
  Element in given dimension.
- void **setValue** (int dimension, double value)

Conversion

- **operator HxScalarInt** () const
  Cast to **HxScalarInt** (p. 1164).
- **operator HxScalarDouble** () const
  Cast to **HxScalarDouble** (p. 1145).
- **operator HxVec2Int** () const
  Cast to **HxVec2Int** (p. 1281).
- **operator HxVec3Int** () const
  Cast to **HxVec3Int** (p. 1321).
- **operator HxVec3Double** () const
  Cast to **HxVec3Double** (p. 1301).
- **operator HxComplex** () const
  Cast to **HxComplex** (p. 506).

Operators

Mathematical definition: **Binary operations on pixel values** (p. 5)

- int **operator==** (const HxVec2Double &v) const
  Equal.
- int **operator!=** (const HxVec2Double &v) const

Not equal.

- int **operator**< (const HxVec2Double &v) const
  Less than.
- int **operator**<= (const HxVec2Double &v) const
  Less equal.
- int **operator**> (const HxVec2Double &v) const
  Greater than.
- int **operator**>= (const HxVec2Double &v) const
  Greater equal.
- const HxVec2Double **SMALL_VAL** = HxVec2Double(0, 0)
  A small value w.r.t to the comparison operators "<" and ">".
- const HxVec2Double **LARGE_VAL** = HxVec2Double(1e300, 1e300)
  A large value w.r.t to the comparison operators "<" and ">".

Unary operations

Mathematical definition: **Unary operations on pixel values** (p. 4)

- HxVec2Double **operator-** () const
  Negation.
- HxVec2Double **complement** () const
  Complement.
- HxVec2Double **abs** () const
  Absolute value.
- HxVec2Double **ceil** () const
  Ceiling.
- HxVec2Double **floor** () const
  Floor.
- HxVec2Double **round** () const
  Round.
- **HxScalarDouble sum** () const
  Sum.
- **HxScalarDouble product** () const
  Product.
- **HxScalarDouble min** () const

Minimum.

- **HxScalarDouble max** () const
  Maximum.
- **HxScalarDouble norm1** () const
  L1 norm.
- **HxScalarDouble norm2** () const
  L2 norm.
- **HxScalarDouble normInf** () const
  L infinity norm.
- HxVec2Double **sqrt** () const
  Square root.
- HxVec2Double **sin** () const
  Sine.
- HxVec2Double **cos** () const
  Cosine.
- HxVec2Double **tan** () const
  Tangent.
- HxVec2Double **asin** () const
  Arc sine.
- HxVec2Double **acos** () const
  Arc cosine.
- HxVec2Double **atan** () const
  Arc tangent.
- **HxScalarDouble atan2** () const
  Arc tangent.
- HxVec2Double **sinh** () const
  Hyperbolic sine.
- HxVec2Double **cosh** () const
  Hyperbolic cosine.
- HxVec2Double **tanh** () const
  Hyperbolic tangent.
- HxVec2Double **exp** () const
  Exponent.

- HxVec2Double **log** () const
  Natural logarithm.
- HxVec2Double **log10** () const
  Base 10 logarithm.

Binary operations

Mathematical definition: **Binary operations on pixel values** (p. 5)

- HxVec2Double & **operator+=** (const HxVec2Double &v)
  Addition and assignment.
- HxVec2Double & **operator-=** (const HxVec2Double &v)
  Subtraction and assignment.
- HxVec2Double & **operator** ∗**=** (const HxVec2Double &v)
  Multiplication and assignment.
- HxVec2Double & **operator/=** (const HxVec2Double &v)
  Division and assignment.
- HxVec2Double **min** (const HxVec2Double &v) const
  Minimum.
- HxVec2Double & **minAssign** (const HxVec2Double &v)
  Minimum and assignment.
- HxVec2Double **max** (const HxVec2Double &v) const
  Maximum.
- HxVec2Double & **maxAssign** (const HxVec2Double &v)
  Maximum and assignment.
- HxVec2Double **inf** (const HxVec2Double &v) const
  Infimum.
- HxVec2Double & **infAssign** (const HxVec2Double &v)
  Infimum and assignment.
- HxVec2Double **sup** (const HxVec2Double &v) const
  Supremum.
- HxVec2Double & **supAssign** (const HxVec2Double &v)
  Supremum and assignment.
- HxVec2Double **pow** (const HxVec2Double &v) const
  Power.

- HxVec2Double **mod** (const HxVec2Double &v) const
  Modulo.
- HxVec2Double **and** (const HxVec2Double &v) const
  And.
- HxVec2Double **or** (const HxVec2Double &v) const
  Or.
- HxVec2Double **xor** (const HxVec2Double &v) const
  Xor.
- HxVec2Double **leftShift** (const HxVec2Double &v) const
  Left shift.
- HxVec2Double **rightShift** (const HxVec2Double &v) const
  Right shift.
- **HxScalarDouble dot** (const HxVec2Double &v) const
  Dot product.
- HxVec2Double **cross** (const HxVec2Double &v) const
  Cross product.
- HxVec2Double **operator+** (const HxVec2Double &v1, const HxVec2Double &v2)
  Addition.
- HxVec2Double **operator-** (const HxVec2Double &v1, const HxVec2Double &v2)
  Subtraction.
- HxVec2Double **operator** $*$ (const HxVec2Double &v1, const HxVec2Double &v2)
  Multiplication.
- HxVec2Double **operator/** (const HxVec2Double &v1, const HxVec2Double &v2)
  Division.

Output

- STD_OSTREAM & **put** (STD_OSTREAM &os) const
  Print value on stream.
- **HxString toString** () const
  Value as a string.

Public Methods

- void * **operator new** (size_t, void *=0)
- HxVec2Double & **operator=** (const HxVec2Double &rhs)

8.452.1 Detailed Description

Class definition vector of 2 doubles.

8.452.2 Constructor & Destructor Documentation

8.452.2.1 HxVec2Double::HxVec2Double () [inline]

Default constructor.

```
323 {
324 }
```

8.452.2.2 HxVec2Double::HxVec2Double (double *x*, double *y*) [inline]

Conversion from native type.

```
328 {
329     _values[0] = x;
330     _values[1] = y;
331 }
```

8.452.2.3 HxVec2Double::HxVec2Double (const HxVec2Double & *v*) [inline]

Copy constructor.

```
335 {
336     _values[0] = v._values[0];
337     _values[1] = v._values[1];
338 }
```

8.452.3 Member Function Documentation

8.452.3.1 int HxVec2Double::dim () const [inline]

Dimensionality.

```
356 {
357     return 2;
358 }
```

8.452.3.2 double HxVec2Double::x () const [inline]

Value of first element.

```
362 {
363     return _values[0];
364 }
```

8.452.3.3 double HxVec2Double::y () const [inline]

Value of second element.

```
368 {
369     return _values[1];
370 }
```

8.452.3.4 double HxVec2Double::getValue (int *dim*) const [inline]

Element in given dimension.

```
374 {
375     return _values[dim - 1];
376 }
```

8.452.3.5 HxVec2Double::operator HxScalarInt () const

Cast to **HxScalarInt** (p. 1164).

```
26 {
27     return (int) _values[0];
28 }
```

8.452.3.6 HxVec2Double::operator HxScalarDouble () const

Cast to **HxScalarDouble** (p. 1145).

```
31 {
32     return _values[0];
33 }
```

8.452.3.7 HxVec2Double::operator HxVec2Int () const

Cast to **HxVec2Int** (p. 1281).

```
36 {
37     return HxVec2Int(int(_values[0]), int(_values[1]));
38 }
```

8.452.3.8 HxVec2Double::operator HxVec3Int () const

Cast to **HxVec3Int** (p. 1321).

```
41 {
42     return HxVec3Int(int(_values[0]), int(_values[1]), 0);
43 }
```

8.452.3.9 HxVec2Double::operator HxVec3Double () const

Cast to **HxVec3Double** (p. 1301).

```
46 {
47     return HxVec3Double(_values[0], _values[1], 0);
48 }
```

8.452.3.10 HxVec2Double::operator HxComplex () const

Cast to **HxComplex** (p. 506).

```
51 {
52     return HxComplex(_values[0], _values[1]);
53 }
```

8.452.3.11 int HxVec2Double::operator== (const HxVec2Double & *v*) const [inline]

Equal.

```
386 {
387     return (_values[0] == v._values[0]) && (_values[1] == v._values[1]);
388 }
```

8.452.3.12 int HxVec2Double::operator!= (const HxVec2Double & *v*) const [inline]

Not equal.

```
392 {
393     return (_values[0] != v._values[0]) || (_values[1] != v._values[1]);
394 }
```

8.452.3.13 int HxVec2Double::operator< (const HxVec2Double & *v*) const [inline]

Less than.

```
398 {
399     return (fabs(_values[0]) + fabs(_values[1])) <
400            (fabs(v._values[0]) + fabs(v._values[1]));
401 }
```

8.452.3.14 int HxVec2Double::operator<= (const HxVec2Double & *v*) const [inline]

Less equal.

```
405 {
406     return (fabs(_values[0]) + fabs(_values[1])) <=
407            (fabs(v._values[0]) + fabs(v._values[1]));
408 }
```

8.452.3.15 int HxVec2Double::operator> (const HxVec2Double & *v*) const [inline]

Greater than.

```
412 {
413     return (fabs(_values[0]) + fabs(_values[1])) >
414            (fabs(v._values[0]) + fabs(v._values[1]));
415 }
```

8.452.3.16 int HxVec2Double::operator>= (const HxVec2Double & *v*) const [inline]

Greater equal.

```
419 {
420     return (fabs(_values[0]) + fabs(_values[1])) >=
421            (fabs(v._values[0]) + fabs(v._values[1]));
422 }
```

8.452.3.17 HxVec2Double HxVec2Double::operator- () const [inline]

Negation.

```
426 {
427     return HxVec2Double(-_values[0], -_values[1]);
428 }
```

8.452.3.18 HxVec2Double HxVec2Double::complement () const [inline]

Complement.

```
432 {
433     return HxVec2Double(-_values[0], -_values[1]);
434 }
```

8.452.3.19 HxVec2Double HxVec2Double::abs () const [inline]

Absolute value.

```
438 {
439     return HxVec2Double(fabs(_values[0]), fabs(_values[1]));
440 }
```

8.452.3.20 HxVec2Double HxVec2Double::ceil () const [inline]

Ceiling.

```
444 {
445     return HxVec2Double(::ceil(_values[0]), ::ceil(_values[1]));
446 }
```

8.452.3.21 HxVec2Double HxVec2Double::floor () const [inline]

Floor.

```
450 {
451     return HxVec2Double(::floor(_values[0]), ::floor(_values[1]));
452 }
```

8.452.3.22 HxVec2Double HxVec2Double::round () const [inline]

Round.

```
456 {
457     return HxVec2Double((int) (_values[0] + ((_values[0] >= 0) ? 0.5 : -0.5)),
458                         (int) (_values[1] + ((_values[1] >= 0) ? 0.5 : -0.5)));
459 }
```

8.452.3.23 HxScalarDouble HxVec2Double::sum () const [inline]

Sum.

```
710 {
711     return _values[0] + _values[1];
712 }
```

8.452.3.24 HxScalarDouble HxVec2Double::product () const [inline]

Product.

```
716 {
717     return _values[0] * _values[1];
718 }
```

8.452.3.25 HxScalarDouble HxVec2Double::min () const [inline]

Minimum.

```
722 {
723     return (_values[0] < _values[1]) ? _values[0] : _values[1];
724 }
```

8.452.3.26 HxScalarDouble HxVec2Double::max () const [inline]

Maximum.

```
728 {
729     return (_values[0] > _values[1]) ? _values[0] : _values[1];
730 }
```

8.452.3.27 HxScalarDouble HxVec2Double::norm1 () const

L1 norm.

```
57 {
58     return fabs(_values[0]) + fabs(_values[1]);
59 }
```

8.452.3.28 HxScalarDouble HxVec2Double::norm2 () const

L2 norm.

```
63 {
64     return ::sqrt(_values[0]*_values[0] + _values[1]*_values[1]);
65 }
```

8.452.3.29 HxScalarDouble HxVec2Double::normInf () const

L infinity norm.

```
69 {
70     return (fabs(_values[0]) > fabs(_values[1])) ? fabs(_values[0]) :
71                                                    fabs(_values[1]);
72 }
```

8.452.3.30 HxVec2Double HxVec2Double::sqrt () const [inline]

Square root.

```
463 {
464     return HxVec2Double(::sqrt(_values[0]), ::sqrt(_values[1]));
465 }
```

8.452.3.31 HxVec2Double HxVec2Double::sin () const [inline]

Sine.

```
469 {
470     return HxVec2Double(::sin(_values[0]), ::sin(_values[1]));
471 }
```

8.452.3.32 HxVec2Double HxVec2Double::cos () const [inline]

Cosine.

```
475 {
476     return HxVec2Double(::cos(_values[0]), ::cos(_values[1]));
477 }
```

8.452.3.33 HxVec2Double HxVec2Double::tan () const [inline]

Tangent.

```
481 {
482     return HxVec2Double(::tan(_values[0]), ::tan(_values[1]));
483 }
```

8.452.3.34 HxVec2Double HxVec2Double::asin () const [inline]

Arc sine.

```
487 {
488     return HxVec2Double(::asin(_values[0]), ::asin(_values[1]));
489 }
```

8.452.3.35 HxVec2Double HxVec2Double::acos () const [inline]

Arc cosine.

```
493 {
494     return HxVec2Double(::acos(_values[0]), ::acos(_values[1]));
495 }
```

8.452.3.36 HxVec2Double HxVec2Double::atan () const [inline]

Arc tangent.

```
499 {
500     return HxVec2Double(::atan(_values[0]), ::atan(_values[1]));
501 }
```

8.452.3.37 HxScalarDouble HxVec2Double::atan2 () const

Arc tangent.

```
76 {
77     return HxScalarDouble(::atan2(_values[0], _values[1]));
78 }
```

8.452.3.38 HxVec2Double HxVec2Double::sinh () const [inline]

Hyperbolic sine.

```
505 {
506     return HxVec2Double(::sinh(_values[0]), ::sinh(_values[1]));
507 }
```

8.452.3.39 HxVec2Double HxVec2Double::cosh () const [inline]

Hyperbolic cosine.

```
511 {
512     return HxVec2Double(::cosh(_values[0]), ::cosh(_values[1]));
513 }
```

8.452.3.40 HxVec2Double HxVec2Double::tanh () const [inline]

Hyperbolic tangent.

```
517 {
518     return HxVec2Double(::tanh(_values[0]), ::tanh(_values[1]));
519 }
```

8.452.3.41 HxVec2Double HxVec2Double::exp () const [inline]

Exponent.

```
523 {
524     return HxVec2Double(::exp(_values[0]), ::exp(_values[1]));
525 }
```

8.452.3.42 HxVec2Double HxVec2Double::log () const [inline]

Natural logarithm.

```
529 {
530     return HxVec2Double(::log(_values[0]), ::log(_values[1]));
531 }
```

8.452.3.43 HxVec2Double HxVec2Double::log10 () const [inline]

Base 10 logarithm.

```
535 {
536     return HxVec2Double(::log10(_values[0]), ::log10(_values[1]));
537 }
```

8.452.3.44 HxVec2Double & HxVec2Double::operator+= (const HxVec2Double & *v*) [inline]

Addition and assignment.

```
541 {
542     _values[0] += v._values[0];
543     _values[1] += v._values[1];
544     return *this;
545 }
```

8.452.3.45 HxVec2Double & HxVec2Double::operator-= (const HxVec2Double & *v*) [inline]

Subtraction and assignment.

```
549 {
550     _values[0] -= v._values[0];
551     _values[1] -= v._values[1];
552     return *this;
553 }
```

8.452.3.46 HxVec2Double & HxVec2Double::operator *= (const HxVec2Double & *v*) [inline]

Multiplication and assignment.

```
557 {
558     _values[0] *= v._values[0];
559     _values[1] *= v._values[1];
560     return *this;
561 }
```

8.452.3.47 HxVec2Double & HxVec2Double::operator/= (const HxVec2Double & *v*) [inline]

Division and assignment.

```
565 {
566     _values[0] /= v._values[0];
567     _values[1] /= v._values[1];
568     return *this;
569 }
```

8.452.3.48 HxVec2Double HxVec2Double::min (const HxVec2Double & *v*) const [inline]

Minimum.

```

687     return (*this);
688 }
```

8.452.3.61 HxVec2Double HxVec2Double::leftShift (const HxVec2Double & *v*) const [inline]

Left shift.

```
692 {
693     return (*this);
694 }
```

8.452.3.62 HxVec2Double HxVec2Double::rightShift (const HxVec2Double & *v*) const [inline]

Right shift.

```
698 {
699     return (*this);
700 }
```

8.452.3.63 HxScalarDouble HxVec2Double::dot (const HxVec2Double & *v*) const

Dot product.

```
82 {
83     return (_values[0] * v._values[0]) + (_values[1] * v._values[1]);
84 }
```

8.452.3.64 HxVec2Double HxVec2Double::cross (const HxVec2Double & *v*) const [inline]

Cross product.

```
704 {
705     return HxVec2Double(0, 0);
706 }
```

8.452.3.65 STD_OSTREAM & HxVec2Double::put (STD_OSTREAM & *os*) const

Print value on stream.

For global operator<<

```
88 {
89     return os << "(" << _values[0] << "," << _values[1] << ")";
90 }
```

8.452.3.66 HxString HxVec2Double::toString () const

Value as a string.

```
93                              {
94     return HxString("(") + makeString(_values[0]) + ", "
95             + makeString(_values[1]) + ")";
96 }
```

8.452.4 Friends And Related Function Documentation

8.452.4.1 HxVec2Double operator+ (const HxVec2Double & *v1*, const HxVec2Double & *v2*) [friend]

Addition.

```
573 {
574     return HxVec2Double(v1._values[0] + v2._values[0],
575                         v1._values[1] + v2._values[1]);
576 }
```

8.452.4.2 HxVec2Double operator- (const HxVec2Double & *v1*, const HxVec2Double & *v2*) [friend]

Subtraction.

```
580 {
581     return HxVec2Double(v1._values[0] - v2._values[0],
582                         v1._values[1] - v2._values[1]);
583 }
```

8.452.4.3 HxVec2Double operator * (const HxVec2Double & *v1*, const HxVec2Double & *v2*) [friend]

Multiplication.

```
587 {
588     return HxVec2Double(v1._values[0] * v2._values[0],
589                         v1._values[1] * v2._values[1]);
590 }
```

8.452.4.4 HxVec2Double operator/ (const HxVec2Double & *v1*, const HxVec2Double & *v2*) [friend]

Division.

```
594 {
595     return HxVec2Double(v1._values[0] / v2._values[0],
596                         v1._values[1] / v2._values[1]);
597 }
```

8.452.5 Member Data Documentation

8.452.5.1 const HxVec2Double HxVec2Double::SMALL_VAL = HxVec2Double(0, 0) [static]

A small value w.r.t to the comparison operators "<" and ">".

Not actually the minimum to avoid overflow.

8.452.5.2 const HxVec2Double HxVec2Double::LARGE_VAL = HxVec2Double(1e300, 1e300) [static]

A large value w.r.t to the comparison operators "<" and ">".

Not actually the maximum to avoid overflow.

The documentation for this class was generated from the following files:

- **HxVec2Double.h**
- HxVec2Double.c

8.453 HxVec2Int Class Reference

Class definition vector of 2 integers.

`#include <HxVec2Int.h>`

Constructors

- **HxVec2Int** ()
  Default constructor.
- **HxVec2Int** (int x, int y)
  Conversion from native type.
- **HxVec2Int** (const HxVec2Int &v)
  Copy constructor.

Inquiry

- int **dim** () const
  Dimensionality.
- int **x** () const
  Value of first element.
- int **y** () const
  Value of second element.
- int **getValue** (int dimension) const

Element in given dimension.

- void **setValue** (int dimension, int value)

Conversion

- **operator HxScalarInt** () const
  Cast to **HxScalarInt** (p. 1164).
- **operator HxScalarDouble** () const
  Cast to **HxScalarDouble** (p. 1145).
- **operator HxVec2Double** () const
  Cast to **HxVec2Double** (p. 1262).
- **operator HxVec3Int** () const
  Cast to **HxVec3Int** (p. 1321).
- **operator HxVec3Double** () const
  Cast to **HxVec3Double** (p. 1301).
- **operator HxComplex** () const
  Cast to **HxComplex** (p. 506).

Operators

Mathematical definition: **Binary operations on pixel values** (p. 5)

- int **operator==** (const HxVec2Int &v) const
  Equal.
- int **operator!=** (const HxVec2Int &v) const
  Not equal.
- int **operator**< (const HxVec2Int &v) const
  Less than.
- int **operator**<= (const HxVec2Int &v) const
  Less equal.
- int **operator**> (const HxVec2Int &v) const
  Greater than.
- int **operator**>= (const HxVec2Int &v) const
  Greater equal.
- const HxVec2Int **SMALL_VAL** = HxVec2Int(0, 0)
  A small value w.r.t to the comparison operators "<" and ">".

- const HxVec2Int **LARGE_VAL** = HxVec2Int(200000000, 200000000)

  A large value w.r.t to the comparison operators "<" and ">".

Unary operations

Mathematical definition: **Unary operations on pixel values** (p. 4)

- HxVec2Int **operator-** () const

  Negation.

- HxVec2Int **complement** () const

  Complement.

- HxVec2Int **abs** () const

  Absolute value.

- HxVec2Int **ceil** () const

  Ceiling.

- HxVec2Int **floor** () const

  Floor.

- HxVec2Int **round** () const

  Round.

- **HxScalarInt sum** () const

  Sum.

- **HxScalarInt product** () const

  Product.

- **HxScalarInt min** () const

  Minimum.

- **HxScalarInt max** () const

  Maximum.

- **HxScalarInt norm1** () const

  L1 norm.

- **HxScalarDouble norm2** () const

  L2 norm.

- **HxScalarInt normInf** () const

  L infinity norm.

- **HxVec2Double sqrt** () const

Square root.

- **HxVec2Double sin** () const
  Sine.
- **HxVec2Double cos** () const
  Cosine.
- **HxVec2Double tan** () const
  Tangent.
- **HxVec2Double asin** () const
  Arc sine.
- **HxVec2Double acos** () const
  Arc cosine.
- **HxVec2Double atan** () const
  Arc tangent.
- **HxScalarDouble atan2** () const
  Arc tangent.
- **HxVec2Double sinh** () const
  Hyperbolic sine.
- **HxVec2Double cosh** () const
  Hyperbolic cosine.
- **HxVec2Double tanh** () const
  Hyperbolic tangent.
- **HxVec2Double exp** () const
  Exponent.
- **HxVec2Double log** () const
  Natural logarithm.
- **HxVec2Double log10** () const
  Base 10 logarithm.

Binary operations

Mathematical definition: **Binary operations on pixel values** (p. 5)

- HxVec2Int & **operator+=** (const HxVec2Int &v)
  Addition and assignment.
- HxVec2Int & **operator-=** (const HxVec2Int &v)

Subtraction and assignment.

- HxVec2Int & **operator** ∗**=** (const HxVec2Int &v)
  Multiplication and assignment.
- HxVec2Int & **operator/=** (const HxVec2Int &v)
  Division and assignment.
- HxVec2Int **min** (const HxVec2Int &v) const
  Minimum.
- HxVec2Int & **minAssign** (const HxVec2Int &v)
  Minimum and assignment.
- HxVec2Int **max** (const HxVec2Int &v) const
  Maximum.
- HxVec2Int & **maxAssign** (const HxVec2Int &v)
  Maximum and assignment.
- HxVec2Int **inf** (const HxVec2Int &v) const
  Infimum.
- HxVec2Int & **infAssign** (const HxVec2Int &v)
  Infimum and assignment.
- HxVec2Int **sup** (const HxVec2Int &v) const
  Supremum.
- HxVec2Int & **supAssign** (const HxVec2Int &v)
  Supremum and assignment.
- HxVec2Int **pow** (const HxVec2Int &v) const
  Power.
- HxVec2Int **mod** (const HxVec2Int &v) const
  Modulo.
- HxVec2Int **and** (const HxVec2Int &v) const
  And.
- HxVec2Int **or** (const HxVec2Int &v) const
  Or.
- HxVec2Int **xor** (const HxVec2Int &v) const
  Xor.
- HxVec2Int **leftShift** (const HxVec2Int &v) const
  Left shift.

- HxVec2Int **rightShift** (const HxVec2Int &v) const
  Right shift.
- **HxScalarInt dot** (const HxVec2Int &v) const
  Dot product.
- HxVec2Int **cross** (const HxVec2Int &v) const
  Cross product.
- HxVec2Int **operator+** (const HxVec2Int &v1, const HxVec2Int &v2)
  Addition.
- HxVec2Int **operator-** (const HxVec2Int &v1, const HxVec2Int &v2)
  Subtraction.
- HxVec2Int **operator** * (const HxVec2Int &v1, const HxVec2Int &v2)
  Multiplication.
- HxVec2Int **operator/** (const HxVec2Int &v1, const HxVec2Int &v2)
  Division.

Output

- STD_OSTREAM & **put** (STD_OSTREAM &os) const
  Print value on stream.
- **HxString toString** () const
  Value as a string.

Public Methods

- void * **operator new** (size_t, void *=0)

8.453.1 Detailed Description

Class definition vector of 2 integers.

8.453.2 Constructor & Destructor Documentation

8.453.2.1 HxVec2Int::HxVec2Int () [inline]

Default constructor.

```
319 {
320 }
```

8.453.2.2 HxVec2Int::HxVec2Int (int *x*, int *y*) [inline]

Conversion from native type.

```
324 {
325     _values[0] = x;
326     _values[1] = y;
327 }
```

8.453.2.3 HxVec2Int::HxVec2Int (const HxVec2Int & *v*) [inline]

Copy constructor.

```
331 {
332     _values[0] = v._values[0];
333     _values[1] = v._values[1];
334 }
```

8.453.3 Member Function Documentation

8.453.3.1 int HxVec2Int::dim () const [inline]

Dimensionality.

```
344 {
345     return 2;
346 }
```

8.453.3.2 int HxVec2Int::x () const [inline]

Value of first element.

```
350 {
351     return _values[0];
352 }
```

8.453.3.3 int HxVec2Int::y () const [inline]

Value of second element.

```
356 {
357     return _values[1];
358 }
```

8.453.3.4 int HxVec2Int::getValue (int *dim*) const [inline]

Element in given dimension.

```
362 {
363     return _values[dim - 1];
364 }
```

8.453.3.5 HxVec2Int::operator HxScalarInt () const

Cast to **HxScalarInt** (p. 1164).

```
26 {
27     return _values[0];
28 }
```

8.453.3.6 HxVec2Int::operator HxScalarDouble () const

Cast to **HxScalarDouble** (p. 1145).

```
31 {
32     return (double) _values[0];
33 }
```

8.453.3.7 HxVec2Int::operator HxVec2Double () const

Cast to **HxVec2Double** (p. 1262).

```
36 {
37     return HxVec2Double(_values[0], _values[1]);
38 }
```

8.453.3.8 HxVec2Int::operator HxVec3Int () const

Cast to **HxVec3Int** (p. 1321).

```
41 {
42     return HxVec3Int(_values[0], _values[1], 0);
43 }
```

8.453.3.9 HxVec2Int::operator HxVec3Double () const

Cast to **HxVec3Double** (p. 1301).

```
46 {
47     return HxVec3Double(_values[0], _values[1], 0);
48 }
```

8.453.3.10 HxVec2Int::operator HxComplex () const

Cast to **HxComplex** (p. 506).

```
51 {
52     return HxComplex(_values[0], _values[1]);
53 }
```

8.453.3.11 int HxVec2Int::operator== (const HxVec2Int & *v*) const [inline]

Equal.

```
374 {
375     return (_values[0] == v._values[0]) && (_values[1] == v._values[1]);
376 }
```

8.453.3.12 int HxVec2Int::operator!= (const HxVec2Int & *v*) const [inline]

Not equal.

```
380 {
381     return (_values[0] != v._values[0]) || (_values[1] != v._values[1]);
382 }
```

8.453.3.13 int HxVec2Int::operator< (const HxVec2Int & *v*) const [inline]

Less than.

```
386 {
387     return (::abs(_values[0]) + ::abs(_values[1])) <
388            (::abs(v._values[0]) + ::abs(v._values[1]));
389 }
```

8.453.3.14 int HxVec2Int::operator<= (const HxVec2Int & *v*) const [inline]

Less equal.

```
393 {
394     return (::abs(_values[0]) + ::abs(_values[1])) <=
395            (::abs(v._values[0]) + ::abs(v._values[1]));
396 }
```

8.453.3.15 int HxVec2Int::operator> (const HxVec2Int & *v*) const [inline]

Greater than.

```
400 {
401     return (::abs(_values[0]) + ::abs(_values[1])) >
402            (::abs(v._values[0]) + ::abs(v._values[1]));
403 }
```

8.453.3.16 int HxVec2Int::operator>= (const HxVec2Int & *v*) const [inline]

Greater equal.

```
407 {
408     return (::abs(_values[0]) + ::abs(_values[1])) >=
409            (::abs(v._values[0]) + ::abs(v._values[1]));
410 }
```

8.453.3.17 HxVec2Int HxVec2Int::operator- () const [inline]

Negation.

```
414 {
415     return HxVec2Int(-_values[0], -_values[1]);
416 }
```

8.453.3.18 HxVec2Int HxVec2Int::complement () const [inline]

Complement.

```
420 {
421     return HxVec2Int(~_values[0], ~_values[1]);
422 }
```

8.453.3.19 HxVec2Int HxVec2Int::abs () const [inline]

Absolute value.

```
426 {
427     return HxVec2Int(::abs(_values[0]), ::abs(_values[1]));
428 }
```

8.453.3.20 HxVec2Int HxVec2Int::ceil () const [inline]

Ceiling.

```
432 {
433     return *this;
434 }
```

8.453.3.21 HxVec2Int HxVec2Int::floor () const [inline]

Floor.

```
438 {
439     return *this;
440 }
```

8.453.3.22 HxVec2Int HxVec2Int::round () const [inline]

Round.

```
444 {
445     return *this;
446 }
```

8.453.3.23 HxScalarInt HxVec2Int::sum () const [inline]

Sum.

```
625 {
626     return _values[0] + _values[1];
627 }
```

8.453.3.24 HxScalarInt HxVec2Int::product () const [inline]

Product.

```
631 {
632     return _values[0] * _values[1];
633 }
```

8.453.3.25 HxScalarInt HxVec2Int::min () const [inline]

Minimum.

```
637 {
638     return (_values[0] < _values[1]) ? _values[0] : _values[1];
639 }
```

8.453.3.26 HxScalarInt HxVec2Int::max () const [inline]

Maximum.

```
643 {
644     return (_values[0] > _values[1]) ? _values[0] : _values[1];
645 }
```

8.453.3.27 HxScalarInt HxVec2Int::norm1 () const

L1 norm.

```
57 {
58     return ::abs(_values[0]) + ::abs(_values[1]);
59 }
```

8.453.3.28 HxScalarDouble HxVec2Int::norm2 () const

L2 norm.

```
63 {
64     return ::sqrt(double(_values[0])*_values[0] + double(_values[1])*_values[1]);
65 }
```

8.453.3.29 HxScalarInt HxVec2Int::normInf () const

L infinity norm.

```
69 {
70     return (::abs(_values[0]) > ::abs(_values[1])) ? ::abs(_values[0]) :
71                                                      ::abs(_values[1]);
72 }
```

8.453.3.30 HxVec2Double HxVec2Int::sqrt () const

Square root.

```
76 {
77     return HxVec2Double(::sqrt(double(_values[0])), ::sqrt(double(_values[1])));
78 }
```

8.453.3.31 HxVec2Double HxVec2Int::sin () const

Sine.

```
82 {
83     return HxVec2Double(::sin(double(_values[0])), ::sin(double(_values[1])));
84 }
```

8.453.3.32 HxVec2Double HxVec2Int::cos () const

Cosine.

```
88 {
89     return HxVec2Double(::cos(double(_values[0])), ::cos(double(_values[1])));
90 }
```

8.453.3.33 HxVec2Double HxVec2Int::tan () const

Tangent.

```
94 {
95     return HxVec2Double(::tan(double(_values[0])), ::tan(double(_values[1])));
96 }
```

8.453.3.34 HxVec2Double HxVec2Int::asin () const

Arc sine.

```
100 {
101     return HxVec2Double(::asin(double(_values[0])), ::asin(double(_values[1])));
102 }
```

8.453.3.35 HxVec2Double HxVec2Int::acos () const

Arc cosine.

```
106 {
107     return HxVec2Double(::acos(double(_values[0])), ::acos(double(_values[1])));
108 }
```

8.453.3.36 HxVec2Double HxVec2Int::atan () const

Arc tangent.

```
112 {
113     return HxVec2Double(::atan(double(_values[0])), ::atan(double(_values[1])));
114 }
```

8.453.3.37 HxScalarDouble HxVec2Int::atan2 () const

Arc tangent.

```
118 {
119     return HxScalarDouble(::atan2(double(_values[0]), double(_values[1])));
120 }
```

8.453.3.38 HxVec2Double HxVec2Int::sinh () const

Hyperbolic sine.

```
124 {
125     return HxVec2Double(::sinh(double(_values[0])), ::sinh(double(_values[1])));
126 }
```

8.453.3.39 HxVec2Double HxVec2Int::cosh () const

Hyperbolic cosine.

```
130 {
131     return HxVec2Double(::cosh(double(_values[0])), ::cosh(double(_values[1])));
132 }
```

8.453.3.40 HxVec2Double HxVec2Int::tanh () const

Hyperbolic tangent.

```
136 {
137     return HxVec2Double(::tanh(double(_values[0])), ::tanh(double(_values[1])));
138 }
```

8.453.3.41 HxVec2Double HxVec2Int::exp () const

Exponent.

```
142 {
143     return HxVec2Double(::exp(double(_values[0])), ::exp(double(_values[1])));
144 }
```

8.453.3.42 HxVec2Double HxVec2Int::log () const

Natural logarithm.

```
148 {
149     return HxVec2Double(::log(double(_values[0])), ::log(double(_values[1])));
150 }
```

8.453.3.43 HxVec2Double HxVec2Int::log10 () const

Base 10 logarithm.

```
154 {
155     return HxVec2Double(::log10(double(_values[0])), ::log10(double(_values[1])));
156 }
```

8.453.3.44 HxVec2Int & HxVec2Int::operator+= (const HxVec2Int & *v*) [inline]

Addition and assignment.

```
450 {
451     _values[0] += v._values[0];
452     _values[1] += v._values[1];
453     return *this;
454 }
```

8.453.3.45 HxVec2Int & HxVec2Int::operator-= (const HxVec2Int & *v*) [inline]

Subtraction and assignment.

```

564     _values[1] = (_values[1] > v._values[1]) ? _values[1] : v._values[1];
565     return *this;
566 }
```

8.453.3.56 HxVec2Int HxVec2Int::pow (const HxVec2Int & *v*) const [inline]

Power.

```
570 {
571     return HxVec2Int((int) (::pow(_values[0], v._values[0]) + 0.5),
572                      (int) (::pow(_values[1], v._values[1]) + 0.5));
573 }
```

8.453.3.57 HxVec2Int HxVec2Int::mod (const HxVec2Int & *v*) const [inline]

Modulo.

```
577 {
578     return HxVec2Int(_values[0] % v._values[0],
579                      _values[1] % v._values[1]);
580 }
```

8.453.3.58 HxVec2Int HxVec2Int::and (const HxVec2Int & *v*) const [inline]

And.

```
584 {
585     return HxVec2Int(_values[0] & v._values[0],
586                      _values[1] & v._values[1]);
587 }
```

8.453.3.59 HxVec2Int HxVec2Int::or (const HxVec2Int & *v*) const [inline]

Or.

```
591 {
592     return HxVec2Int(_values[0] | v._values[0],
593                      _values[1] | v._values[1]);
594 }
```

8.453.3.60 HxVec2Int HxVec2Int::xor (const HxVec2Int & *v*) const [inline]

Xor.

```
598 {
599     return HxVec2Int(_values[0] ^ v._values[0],
600                      _values[1] ^ v._values[1]);
601 }
```

8.453.3.61 HxVec2Int HxVec2Int::leftShift (const HxVec2Int & *v*) const [inline]

Left shift.

```
605 {
606     return HxVec2Int(_values[0] << v._values[0],
607                      _values[1] << v._values[1]);
608 }
```

8.453.3.62 HxVec2Int HxVec2Int::rightShift (const HxVec2Int & *v*) const [inline]

Right shift.

```
612 {
613     return HxVec2Int(_values[0] >> v._values[0],
614                      _values[1] >> v._values[1]);
615 }
```

8.453.3.63 HxScalarInt HxVec2Int::dot (const HxVec2Int & *v*) const

Dot product.

```
160 {
161     return (_values[0] * v._values[0]) + (_values[1] * v._values[1]);
162 }
```

8.453.3.64 HxVec2Int HxVec2Int::cross (const HxVec2Int & *v*) const [inline]

Cross product.

```
619 {
620     return HxVec2Int(0, 0);
621 }
```

8.453.3.65 STD_OSTREAM & HxVec2Int::put (STD_OSTREAM & *os*) const

Print value on stream.

For global operator<<

```
166 {
167     return os << "(" << _values[0] << "," << _values[1] << ")";
168 }
```

8.453.3.66 HxString HxVec2Int::toString () const

Value as a string.

```
171                             {
172     return HxString("(") + makeString(_values[0]) + ", "
173             + makeString(_values[1]) + ")";
174 }
```

8.453.4 Friends And Related Function Documentation

8.453.4.1 HxVec2Int operator+ (const HxVec2Int & *v1*, const HxVec2Int & *v2*) [friend]

Addition.

```
482 {
483     return HxVec2Int(v1._values[0] + v2._values[0],
484                      v1._values[1] + v2._values[1]);
485 }
```

8.453.4.2 HxVec2Int operator- (const HxVec2Int & *v1*, const HxVec2Int & *v2*) [friend]

Subtraction.

```
489 {
490     return HxVec2Int(v1._values[0] - v2._values[0],
491                      v1._values[1] - v2._values[1]);
492 }
```

8.453.4.3 HxVec2Int operator * (const HxVec2Int & *v1*, const HxVec2Int & *v2*) [friend]

Multiplication.

```
496 {
497     return HxVec2Int(v1._values[0] * v2._values[0],
498                      v1._values[1] * v2._values[1]);
499 }
```

8.453.4.4 HxVec2Int operator/ (const HxVec2Int & *v1*, const HxVec2Int & *v2*) [friend]

Division.

```
503 {
504     return HxVec2Int(v1._values[0] / v2._values[0],
505                      v1._values[1] / v2._values[1]);
506 }
```

8.453.5 Member Data Documentation

8.453.5.1 const HxVec2Int HxVec2Int::SMALL_VAL = HxVec2Int(0, 0) [static]

A small value w.r.t to the comparison operators "<" and ">".

Not actually the minimum to avoid overflow.

8.453.5.2 const HxVec2Int HxVec2Int::LARGE_VAL = HxVec2Int(200000000, 200000000) [static]

A large value w.r.t to the comparison operators "<" and ">".

Not actually the maximum to avoid overflow.

The documentation for this class was generated from the following files:

- **HxVec2Int.h**
- HxVec2Int.c

8.454 HxVec2Tem Class Template Reference

Template class for representation of vector of 2 scalars of type T.

8.454.1 Detailed Description

template<class T> class HxVec2Tem< T >

Template class for representation of vector of 2 scalars of type T.

The documentation for this class was generated from the following files:

- **HxVec2Tem.h**
- HxVec2Tem.c

8.455 HxVec3Double Class Reference

Class definition vector of 3 doubles.

`#include <HxVec3Double.h>`

Constructors

- **HxVec3Double** ()
  Default constructor.
- **HxVec3Double** (double x, double y, double z)
  Conversion from native type.
- **HxVec3Double** (const HxVec3Double &v)
  Copy constructor.

Inquiry

- int **dim** () const
  Dimensionality.
- double **x** () const
  Value of first element.
- double **y** () const
  Value of second element.
- double **z** () const
  Value of third element.
- double **getValue** (int dimension) const
  Element in given dimension.
- void **setValue** (int dimension, double value)

Conversion

- **operator HxScalarInt** () const
  Cast to **HxScalarInt** (p. 1164).
- **operator HxScalarDouble** () const
  Cast to **HxScalarDouble** (p. 1145).
- **operator HxVec2Int** () const
  Cast to **HxVec2Int** (p. 1281).
- **operator HxVec2Double** () const
  Cast to **HxVec2Double** (p. 1262).
- **operator HxVec3Int** () const
  Cast to **HxVec3Int** (p. 1321).
- **operator HxComplex** () const
  Cast to **HxComplex** (p. 506).

Operators

Mathematical definition: **Binary operations on pixel values** (p. 5)

- int **operator==** (const HxVec3Double &v) const
  Equal.
- int **operator!=** (const HxVec3Double &v) const
  Not equal.
- int **operator**< (const HxVec3Double &v) const
  Less than.
- int **operator**<= (const HxVec3Double &v) const
  Less equal.
- int **operator**> (const HxVec3Double &v) const
  Greater than.
- int **operator**>= (const HxVec3Double &v) const
  Greater equal.
- const HxVec3Double **SMALL_VAL** = HxVec3Double(0, 0, 0)
  A small value w.r.t to the comparison operators "<" and ">".
- const HxVec3Double **LARGE_VAL** = HxVec3Double(1e300, 1e300, 1e300)
  A large value w.r.t to the comparison operators "<" and ">".

Unary operations

Mathematical definition: **Unary operations on pixel values** (p. 4)

- HxVec3Double **operator-** () const
  Negation.
- HxVec3Double **complement** () const
  Complement.
- HxVec3Double **abs** () const
  Absolute value.
- HxVec3Double **ceil** () const
  Ceiling.
- HxVec3Double **floor** () const
  Floor.
- HxVec3Double **round** () const
  Round.
- **HxScalarDouble sum** () const
  Sum.
- **HxScalarDouble product** () const
  Product.
- **HxScalarDouble min** () const
  Minimum.
- **HxScalarDouble max** () const
  Maximum.
- **HxScalarDouble norm1** () const
  L1 norm.
- **HxScalarDouble norm2** () const
  L2 norm.
- **HxScalarDouble normInf** () const
  L infinity norm.
- HxVec3Double **sqrt** () const
  Square root.
- HxVec3Double **sin** () const
  Sine.
- HxVec3Double **cos** () const

Cosine.

- HxVec3Double **tan** () const
  Tangent.
- HxVec3Double **asin** () const
  Arc sine.
- HxVec3Double **acos** () const
  Arc cosine.
- HxVec3Double **atan** () const
  Arc tangent.
- **HxScalarDouble atan2** () const
  Arc tangent.
- HxVec3Double **sinh** () const
  Hyperbolic sine.
- HxVec3Double **cosh** () const
  Hyperbolic cosine.
- HxVec3Double **tanh** () const
  Hyperbolic tangent.
- HxVec3Double **exp** () const
  Exponent.
- HxVec3Double **log** () const
  Natural logarithm.
- HxVec3Double **log10** () const
  Base 10 logarithm.

Binary operations

Mathematical definition: **Binary operations on pixel values** (p. 5)

- HxVec3Double & **operator+=** (const HxVec3Double &v)
  Addition and assignment.
- HxVec3Double & **operator-=** (const HxVec3Double &v)
  Subtraction and assignment.
- HxVec3Double & **operator** ∗**=** (const HxVec3Double &v)
  Multiplication and assignment.
- HxVec3Double & **operator/=** (const HxVec3Double &v)

Division and assignment.

- HxVec3Double **min** (const HxVec3Double &v) const
  Minimum.
- HxVec3Double & **minAssign** (const HxVec3Double &v)
  Minimum and assignment.
- HxVec3Double **max** (const HxVec3Double &v) const
  Maximum.
- HxVec3Double & **maxAssign** (const HxVec3Double &v)
  Maximum and assignment.
- HxVec3Double **inf** (const HxVec3Double &v) const
  Infimum.
- HxVec3Double & **infAssign** (const HxVec3Double &v)
  Infimum and assignment.
- HxVec3Double **sup** (const HxVec3Double &v) const
  Supremum.
- HxVec3Double & **supAssign** (const HxVec3Double &v)
  Supremum and assignment.
- HxVec3Double **pow** (const HxVec3Double &v) const
  Power.
- HxVec3Double **mod** (const HxVec3Double &v) const
  Modulo.
- HxVec3Double **and** (const HxVec3Double &v) const
  And.
- HxVec3Double **or** (const HxVec3Double &v) const
  Or.
- HxVec3Double **xor** (const HxVec3Double &v) const
  Xor.
- HxVec3Double **leftShift** (const HxVec3Double &v) const
  Left shift.
- HxVec3Double **rightShift** (const HxVec3Double &v) const
  Right shift.
- **HxScalarDouble dot** (const HxVec3Double &v) const
  Dot product.

- HxVec3Double **cross** (const HxVec3Double &v) const
  Cross product.
- HxVec3Double **operator+** (const HxVec3Double &v1, const HxVec3Double &v2)
  Addition.
- HxVec3Double **operator-** (const HxVec3Double &v1, const HxVec3Double &v2)
  Subtraction.
- HxVec3Double **operator** * (const HxVec3Double &v1, const HxVec3Double &v2)
  Multiplication.
- HxVec3Double **operator/** (const HxVec3Double &v1, const HxVec3Double &v2)
  Division.

Output

- STD_OSTREAM & **put** (STD_OSTREAM &os) const
  Print value on stream.
- **HxString toString** () const
  Value as a string.

Public Methods

- void * **operator new** (size_t, void *=0)

8.455.1 Detailed Description

Class definition vector of 3 doubles.

8.455.2 Constructor & Destructor Documentation

8.455.2.1 HxVec3Double::HxVec3Double () [inline]

Default constructor.

```
323 {
324 }
```

8.455.2.2 HxVec3Double::HxVec3Double (double *x*, double *y*, double *z*) [inline]

Conversion from native type.

```
328 {
329     _values[0] = x;
330     _values[1] = y;
331     _values[2] = z;
332 }
```

8.455.2.3 HxVec3Double::HxVec3Double (const HxVec3Double & *v*) [inline]

Copy constructor.

```
336 {
337     _values[0] = v._values[0];
338     _values[1] = v._values[1];
339     _values[2] = v._values[2];
340 }
```

8.455.3 Member Function Documentation

8.455.3.1 int HxVec3Double::dim () const [inline]

Dimensionality.

```
350 {
351     return 3;
352 }
```

8.455.3.2 double HxVec3Double::x () const [inline]

Value of first element.

```
356 {
357     return _values[0];
358 }
```

8.455.3.3 double HxVec3Double::y () const [inline]

Value of second element.

```
362 {
363     return _values[1];
364 }
```

8.455.3.4 double HxVec3Double::z () const [inline]

Value of third element.

```
368 {
369     return _values[2];
370 }
```

8.455.3.5 double HxVec3Double::getValue (int *dimension*) const [inline]

Element in given dimension.

```
374 {
375     return _values[dimension - 1];
376 }
```

8.455.3.6 HxVec3Double::operator HxScalarInt () const

Cast to **HxScalarInt** (p. 1164).

```
28 {
29     return (int) _values[0];
30 }
```

8.455.3.7 HxVec3Double::operator HxScalarDouble () const

Cast to **HxScalarDouble** (p. 1145).

```
33 {
34     return _values[0];
35 }
```

8.455.3.8 HxVec3Double::operator HxVec2Int () const

Cast to **HxVec2Int** (p. 1281).

```
38 {
39     return HxVec2Int(int(_values[0]), int(_values[1]));
40 }
```

8.455.3.9 HxVec3Double::operator HxVec2Double () const

Cast to **HxVec2Double** (p. 1262).

```
43 {
44     return HxVec2Double(_values[0], _values[1]);
45 }
```

8.455.3.10 HxVec3Double::operator HxVec3Int () const

Cast to **HxVec3Int** (p. 1321).

```
48 {
49     return HxVec3Int(int(_values[0]), int(_values[1]), int(_values[2]));
50 }
```

8.455.3.11 HxVec3Double::operator HxComplex () const

Cast to **HxComplex** (p. 506).

```
53 {
54     return HxComplex(_values[0], _values[1]);
55 }
```

8.455.3.12 int HxVec3Double::operator== (const HxVec3Double & *v*) const [inline]

Equal.

```
386 {

```

8.455.5 Member Data Documentation

8.455.5.1 const HxVec3Double HxVec3Double::SMALL_VAL = HxVec3Double(0, 0, 0) [static]

A small value w.r.t to the comparison operators "<" and ">".

Not actually the minimum to avoid overflow.

8.455.5.2 const HxVec3Double HxVec3Double::LARGE_VAL = HxVec3Double(1e300, 1e300, 1e300) [static]

A large value w.r.t to the comparison operators "<" and ">".

Not actually the maximum to avoid overflow.

The documentation for this class was generated from the following files:

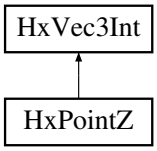
- **HxVec3Double.h**
- HxVec3Double.c

8.456 HxVec3Int Class Reference

Class definition vector of 3 integers.

`#include <HxVec3Int.h>`

Inheritance diagram for HxVec3Int::



Constructors

- **HxVec3Int** ()
  Default constructor.
- **HxVec3Int** (int x, int y, int z)
  Conversion from native type.
- **HxVec3Int** (const HxVec3Int &v)
  Copy constructor.

Inquiry

- int **dim** () const
  Dimensionality.
- int **x** () const
  Value of first element.
- int **y** () const
  Value of second element.
- int **z** () const
  Value of third element.
- int **getValue** (int dimension) const
  Element in given dimension.
- void **setValue** (int dimension, int value)

Conversion

- **operator HxScalarInt** () const
  Cast to **HxScalarInt** (p. 1164).

- **operator HxScalarDouble** () const
  Cast to **HxScalarDouble** (p. 1145).
- **operator HxVec2Int** () const
  Cast to **HxVec2Int** (p. 1281).
- **operator HxVec2Double** () const
  Cast to **HxVec2Double** (p. 1262).
- **operator HxVec3Double** () const
  Cast to **HxVec3Double** (p. 1301).
- **operator HxComplex** () const
  Cast to **HxComplex** (p. 506).

Operators

Mathematical definition: **Binary operations on pixel values** (p. 5)

- int **operator==** (const HxVec3Int &v) const
  Equal.
- int **operator!=** (const HxVec3Int &v) const
  Not equal.
- int **operator**< (const HxVec3Int &v) const
  Less than.
- int **operator**<= (const HxVec3Int &v) const
  Less equal.
- int **operator**> (const HxVec3Int &v) const
  Greater than.
- int **operator**>= (const HxVec3Int &v) const
  Greater equal.
- const HxVec3Int **SMALL_VAL** = HxVec3Int(0, 0, 0)
  A small value w.r.t to the comparison operators "<" and ">".
- const HxVec3Int **LARGE_VAL** = HxVec3Int(200000000, 200000000, 200000000)
  A large value w.r.t to the comparison operators "<" and ">".

Unary operations

Mathematical definition: **Unary operations on pixel values** (p. 4)

- HxVec3Int **operator-** () const
  Negation.
- HxVec3Int **complement** () const
  Complement.
- HxVec3Int **abs** () const
  Absolute value.
- HxVec3Int **ceil** () const
  Ceiling.
- HxVec3Int **floor** () const
  Floor.
- HxVec3Int **round** () const
  Round.
- **HxScalarInt sum** () const
  Sum.
- **HxScalarInt product** () const
  Product.
- **HxScalarInt min** () const
  Minimum.
- **HxScalarInt max** () const
  Maximum.
- **HxScalarInt norm1** () const
  L1 norm.
- **HxScalarDouble norm2** () const
  L2 norm.
- **HxScalarInt normInf** () const
  L infinity norm.
- **HxVec3Double sqrt** () const
  Square root.
- **HxVec3Double sin** () const
  Sine.
- **HxVec3Double cos** () const

Cosine.

- **HxVec3Double tan** () const
  Tangent.
- **HxVec3Double asin** () const
  Arc sine.
- **HxVec3Double acos** () const
  Arc cosine.
- **HxVec3Double atan** () const
  Arc tangent.
- **HxScalarDouble atan2** () const
  Arc tangent.
- **HxVec3Double sinh** () const
  Hyperbolic sine.
- **HxVec3Double cosh** () const
  Hyperbolic cosine.
- **HxVec3Double tanh** () const
  Hyperbolic tangent.
- **HxVec3Double exp** () const
  Exponent.
- **HxVec3Double log** () const
  Natural logarithm.
- **HxVec3Double log10** () const
  Base 10 logarithm.

Binary operations

Mathematical definition: **Binary operations on pixel values** (p. 5)

- HxVec3Int & **operator+=** (const HxVec3Int &v)
  Addition and assignment.
- HxVec3Int & **operator-=** (const HxVec3Int &v)
  Subtraction and assignment.
- HxVec3Int & **operator** ∗**=** (const HxVec3Int &v)
  Multiplication and assignment.
- HxVec3Int & **operator/=** (const HxVec3Int &v)

Division and assignment.

- HxVec3Int **min** (const HxVec3Int &v) const
  Minimum.
- HxVec3Int & **minAssign** (const HxVec3Int &v)
  Minimum and assignment.
- HxVec3Int **max** (const HxVec3Int &v) const
  Maximum.
- HxVec3Int & **maxAssign** (const HxVec3Int &v)
  Maximum and assignment.
- HxVec3Int **inf** (const HxVec3Int &v) const
  Infimum.
- HxVec3Int & **infAssign** (const HxVec3Int &v)
  Infimum and assignment.
- HxVec3Int **sup** (const HxVec3Int &v) const
  Supremum.
- HxVec3Int & **supAssign** (const HxVec3Int &v)
  Supremum and assignment.
- HxVec3Int **pow** (const HxVec3Int &v) const
  Power.
- HxVec3Int **mod** (const HxVec3Int &v) const
  Modulo.
- HxVec3Int **and** (const HxVec3Int &v) const
  And.
- HxVec3Int **or** (const HxVec3Int &v) const
  Or.
- HxVec3Int **xor** (const HxVec3Int &v) const
  Xor.
- HxVec3Int **leftShift** (const HxVec3Int &v) const
  Left shift.
- HxVec3Int **rightShift** (const HxVec3Int &v) const
  Right shift.
- **HxScalarInt dot** (const HxVec3Int &v) const
  Dot product.

- HxVec3Int **cross** (const HxVec3Int &v) const
  Cross product.
- HxVec3Int **operator+** (const HxVec3Int &v1, const HxVec3Int &v2)
  Addition.
- HxVec3Int **operator-** (const HxVec3Int &v1, const HxVec3Int &v2)
  Subtraction.
- HxVec3Int **operator** * (const HxVec3Int &v1, const HxVec3Int &v2)
  Multiplication.
- HxVec3Int **operator/** (const HxVec3Int &v1, const HxVec3Int &v2)
  Division.

Output

- STD_OSTREAM & **put** (STD_OSTREAM &os) const
  Print value on stream.
- **HxString toString** () const
  Value as a string.

Public Methods

- void * **operator new** (size_t, void *=0)

8.456.1 Detailed Description

Class definition vector of 3 integers.

8.456.2 Constructor & Destructor Documentation

8.456.2.1 HxVec3Int::HxVec3Int () [inline]

Default constructor.

```
322 {
323 }
```

8.456.2.2 HxVec3Int::HxVec3Int (int *x*, int *y*, int *z*) [inline]

Conversion from native type.

```
327 {
328     _values[0] = x;
329     _values[1] = y;
330     _values[2] = z;
331 }
```

8.456.2.3 HxVec3Int::HxVec3Int (const HxVec3Int & *v*) [inline]

Copy constructor.

```
335 {
336     _values[0] = v._values[0];
337     _values[1] = v._values[1];
338     _values[2] = v._values[2];
339 }
```

8.456.3 Member Function Documentation

8.456.3.1 int HxVec3Int::dim () const [inline]

Dimensionality.

```
349 {
350     return 3;
351 }
```

8.456.3.2 int HxVec3Int::x () const [inline]

Value of first element.

```
355 {
356     return _values[0];
357 }
```

8.456.3.3 int HxVec3Int::y () const [inline]

Value of second element.

```
361 {
362     return _values[1];
363 }
```

8.456.3.4 int HxVec3Int::z () const [inline]

Value of third element.

```
367 {
368     return _values[2];
369 }
```

8.456.3.5 int HxVec3Int::getValue (int *dimension*) const [inline]

Element in given dimension.

```
373 {
374     return _values[dimension - 1];
375 }
```

8.456.3.6 HxVec3Int::operator HxScalarInt () const

Cast to **HxScalarInt** (p. 1164).

```
28 {
29     return _values[0];
30 }
```

8.456.3.7 HxVec3Int::operator HxScalarDouble () const

Cast to **HxScalarDouble** (p. 1145).

```
33 {
34     return (double) _values[0];
35 }
```

8.456.3.8 HxVec3Int::operator HxVec2Int () const

Cast to **HxVec2Int** (p. 1281).

```
39 {
40     return HxVec2Int(_values[0], _values[1]);
41 }
```

8.456.3.9 HxVec3Int::operator HxVec2Double () const

Cast to **HxVec2Double** (p. 1262).

```
44 {
45     return HxVec2Double(_values[0], _values[1]);
46 }
```

8.456.3.10 HxVec3Int::operator HxVec3Double () const

Cast to **HxVec3Double** (p. 1301).

```
49 {
50     return HxVec3Double(_values[0], _values[1], _values[2]);
51 }
```

8.456.3.11 HxVec3Int::operator HxComplex () const

Cast to **HxComplex** (p. 506).

```
54 {
55     return HxComplex(_values[0], _values[1]);
56 }
```

8.456.3.12 int HxVec3Int::operator== (const HxVec3Int & *v*) const [inline]

Equal.

```
385 {
386     return (_values[0] == v._values[0]) && (_values[1] == v._values[1]) &&
387            (_values[2] == v._values[2]);
388 }
```

8.456.3.13 int HxVec3Int::operator!= (const HxVec3Int & *v*) const [inline]

Not equal.

```
392 {
393     return (_values[0] != v._values[0]) || (_values[1] != v._values[1]) ||
394            (_values[2] != v._values[2]);
395 }
```

8.456.3.14 int HxVec3Int::operator< (const HxVec3Int & *v*) const [inline]

Less than.

```
399 {
400     return (::abs(_values[0]) + ::abs(_values[1]) + ::abs(_values[2])) <
401            (::abs(v._values[0]) + ::abs(v._values[1]) + ::abs(v._values[2]));
402 }
```

8.456.3.15 int HxVec3Int::operator<= (const HxVec3Int & *v*) const [inline]

Less equal.

```
406 {
407     return (::abs(_values[0]) + ::abs(_values[1]) + ::abs(_values[2])) <=
408            (::abs(v._values[0]) + ::abs(v._values[1]) + ::abs(v._values[2]));
409 }
```

8.456.3.16 int HxVec3Int::operator> (const HxVec3Int & *v*) const [inline]

Greater than.

```
413 {
414     return (::abs(_values[0]) + ::abs(_values[1]) + ::abs(_values[2])) >
415            (::abs(v._values[0]) + ::abs(v._values[1]) + ::abs(v._values[2]));
416 }
```

8.456.3.17 int HxVec3Int::operator>= (const HxVec3Int & *v*) const [inline]

Greater equal.

```
420 {
421     return (::abs(_values[0]) + ::abs(_values[1]) + ::abs(_values[2])) >=
422            (::abs(v._values[0]) + ::abs(v._values[1]) + ::abs(v._values[2]));
423 }
```

8.456.3.18 HxVec3Int HxVec3Int::operator- () const [inline]

Negation.

```
427 {
428     return HxVec3Int(-_values[0], -_values[1], -_values[2]);
429 }
```

8.456.3.19 HxVec3Int HxVec3Int::complement () const [inline]

Complement.

```
433 {
434     return HxVec3Int(~_values[0], ~_values[1], ~_values[2]);
435 }
```

8.456.3.20 HxVec3Int HxVec3Int::abs () const [inline]

Absolute value.

```
439 {
440     return HxVec3Int(::abs(_values[0]), ::abs(_values[1]), ::abs(_values[2]));
441 }
```

8.456.3.21 HxVec3Int HxVec3Int::ceil () const [inline]

Ceiling.

```
445 {
446     return *this;
447 }
```

8.456.3.22 HxVec3Int HxVec3Int::floor () const [inline]

Floor.

```
451 {
452     return *this;
453 }
```

8.456.3.23 HxVec3Int HxVec3Int::round () const [inline]

Round.

```
457 {
458     return *this;
459 }
```

8.456.3.24 HxScalarInt HxVec3Int::sum () const [inline]

Sum.

```
463 {
464     return _values[0] + _values[1] + _values[2];
465 }
```

8.456.3.25 HxScalarInt HxVec3Int::product () const [inline]

Product.

```
469 {
470     return _values[0] * _values[1] * _values[2];
471 }
```

8.456.3.26 HxScalarInt HxVec3Int::min () const

Minimum.

```
60 {
61     return (_values[0] < _values[1]) ?
62         ((_values[0] < _values[2]) ? _values[0] : _values[2]) :
63         ((_values[1] < _values[2]) ? _values[1] : _values[2]);
64 }
```

8.456.3.27 HxScalarInt HxVec3Int::max () const

Maximum.

```
68 {
69     return (_values[0] > _values[1]) ?
70         ((_values[0] > _values[2]) ? _values[0] : _values[2]) :

627 }
```

8.456.3.60 HxVec3Int HxVec3Int::or (const HxVec3Int & *v*) const [inline]

Or.

```
631 {
632     return HxVec3Int(_values[0] | v._values[0],
633                      _values[1] | v._values[1],
634                      _values[2] | v._values[2]);
635 }
```

8.456.3.61 HxVec3Int HxVec3Int::xor (const HxVec3Int & *v*) const [inline]

Xor.

```
639 {
640     return HxVec3Int(_values[0] ^ v._values[0],
641                      _values[1] ^ v._values[1],
642                      _values[2] ^ v._values[2]);
643 }
```

8.456.3.62 HxVec3Int HxVec3Int::leftShift (const HxVec3Int & *v*) const [inline]

Left shift.

```
647 {
648     return HxVec3Int(_values[0] << v._values[0],
649                      _values[1] << v._values[1],
650                      _values[2] << v._values[2]);
651 }
```

8.456.3.63 HxVec3Int HxVec3Int::rightShift (const HxVec3Int & *v*) const [inline]

Right shift.

```
655 {
656     return HxVec3Int(_values[0] >> v._values[0],
657                      _values[1] >> v._values[1],
658                      _values[2] >> v._values[2]);
659 }
```

8.456.3.64 HxScalarInt HxVec3Int::dot (const HxVec3Int & *v*) const

Dot product.

```
210 {
211     return (_values[0] * v._values[0]) +
212            (_values[1] * v._values[1]) +
213            (_values[2] * v._values[2]);
214 }
```

8.456.3.65 HxVec3Int HxVec3Int::cross (const HxVec3Int & *v*) const [inline]

Cross product.

```
663 {
664     return HxVec3Int(_values[1] * v._values[2] - _values[2] * v._values[1],
665                      _values[2] * v._values[0] - _values[0] * v._values[2],
666                      _values[0] * v._values[1] - _values[1] * v._values[0]);
667 }
```

8.456.3.66 STD_OSTREAM & HxVec3Int::put (STD_OSTREAM & *os*) const

Print value on stream.

For global operator<<

```
218 {
219     return os << "(" << _values[0] << "," << _values[1] << "," <<
220         _values[2] << ")";
221 }
```

8.456.3.67 HxString HxVec3Int::toString () const

Value as a string.

```
224                           {
225     return HxString("(") + makeString(_values[0]) + ", "
226             + makeString(_values[1]) + ", "
227             + makeString(_values[2]) + ")";
228 }
```

8.456.4 Friends And Related Function Documentation

8.456.4.1 HxVec3Int operator+ (const HxVec3Int & *v1*, const HxVec3Int & *v2*) [friend]

Addition.

```
511 {
512     return HxVec3Int(v1._values[0] + v2._values[0],
513                      v1._values[1] + v2._values[1],

538                      v1._values[2] / v2._values[2]);
539 }
```

8.456.5 Member Data Documentation

8.456.5.1 const HxVec3Int HxVec3Int::SMALL_VAL = HxVec3Int(0, 0, 0) [static]

A small value w.r.t to the comparison operators "<" and ">".

Not actually the minimum to avoid overflow.

8.456.5.2 const HxVec3Int HxVec3Int::LARGE_VAL = HxVec3Int(200000000, 200000000, 200000000) [static]

A large value w.r.t to the comparison operators "<" and ">".

Not actually the maximum to avoid overflow.

The documentation for this class was generated from the following files:

- **HxVec3Int.h**
- HxVec3Int.c

8.457.1 Detailed Description

template<class T> class HxVec3Tem< T >

Template class for representation of vector of 3 scalars of type T.

The documentation for this class was generated from the following files:

- **HxVec3Tem.h**
- HxVec3Tem.c

8.458 HxVector Class Reference

Class definition for vectors.

`#include <HxVector.h>`

Constructors

- **HxVector** ()

  Empty vector.

- **HxVector** (int n)

  Empty vector of given size.

- **HxVector** (int n, double *data)

  vector with given data.

- **HxVector** (double a0, double a1)

  Vector of size 2, with given values.

- **HxVector** (double a0, double a1, double a2)

  Vector of size 3, with given values.

- **HxVector** (double a0, double a1, double a2, double a3)

  Vector of size 4, with given values.

- **HxVector** (const HxVector &v)

  Copy constructor.

- **HxVector** (const **HxMatrix** &m)

  Copy from matrix constructor.

Inquiry

- int **nElem** () const

  Number of elements.

- int **valid** () const

  Indicates whether the vector is valid.

Operators

- HxVector & **operator=** (double a)

  Assign constant value.

- HxVector & **operator=** (const HxVector &v)

  Normal assignment.

- double & **operator[ ]** (int i) const
  Subscripting, start with 0.
- HxVector **operator-** () const
  Unary minus.
- double **operator** ∗ (const HxVector &a, const HxVector &b)
  Multiplication.
- HxVector **operator** ∗ (const double a, const HxVector &b)
  Multiplication.
- HxVector **operator** ∗ (const HxVector &a, const double b)
  Multiplication.
- HxVector **operator/** (const HxVector &a, double b)
  Division.
- HxVector **operator/** (double a, const HxVector &b)
  Division.
- HxVector **operator+** (const HxVector &a, const HxVector &b)
  Addition.
- HxVector **operator+** (const HxVector &a, double b)
  Addition.
- HxVector **operator+** (double a, const HxVector &b)
  Addition.
- HxVector **operator-** (const HxVector &a, const HxVector &b)
  Subtraction.
- HxVector **operator-** (const HxVector &a, double b)
  Subtraction.
- HxVector **operator-** (double a, const HxVector &b)
  Subtraction.
- int **operator==** (const HxVector &a, const HxVector &b)
  Equal.
- int **operator!=** (const HxVector &a, const HxVector &b)
  Not equal.

Operations

- **HxMatrix t** () const
  Transpose Matrix.
- **HxMatrix diag** () const
  Diagonal Matrix.
- HxVector **add** (const HxVector &b) const
  Addition.
- HxVector **add** (const double val) const
  Addition.

  Multiplication.
- HxVector **mul** (const double val) const
  Multiplication.
- HxVector **div** (const double val) const
  Division.
- HxVector **sin** () const
  Apply sin to each element.
- HxVector **cos** () const
  Apply cos to each element.
- HxVector **tan** () const
  Apply tan to each element.
- HxVector **sinh** () const
  Apply sinh to each element.
- HxVector **cosh** () const
  Apply cosh to each element.
- HxVector **tanh** () const
  Apply tanh to each element.

- HxVector **exp** () const
  Apply exp to each element.
- HxVector **log** () const
  Apply log to each element.
- HxVector **sqrt** () const
  Apply sqrt to each element.
- HxVector **abs** () const
  Apply abs to each element.
- HxVector **sgn** () const
  Apply sgn to each element.
- HxVector **map** (double(∗f)(double)) const
  Map f to each element of this.

8.458.1 Detailed Description

Class definition for vectors.

The vector may have arbitrary size.

8.458.2 Constructor & Destructor Documentation

8.458.2.1 HxVector::HxVector () [inline]

Empty vector.

```
216 {
217     _n = 0;
218     _data = 0;
219 }
```

8.458.2.2 HxVector::HxVector (int *n*) [inline]

Empty vector of given size.

```
222 {
223     _n = n;
224     _data = new double[_n];
225 }
```

8.458.2.3 HxVector::HxVector (int *n*, double * *data*) [inline]

vector with given data.

```
228 {
229     _n = n;
230     _data = data;
231 }
```

8.458.2.4 HxVector::HxVector (double *a0*, double *a1*) [inline]

Vector of size 2, with given values.

```
234 {
235     _n = 2;
236     _data = new double[_n];
237     _data[0] = a0;
238     _data[1] = a1;
239 }
```

8.458.2.5 HxVector::HxVector (double *a0*, double *a1*, double *a2*) [inline]

Vector of size 3, with given values.

```
242 {
243     _n = 3;
244     _data = new double[_n];
245     _data[0] = a0;
246     _data[1] = a1;
247     _data[2] = a2;
248 }
```

8.458.2.6 HxVector::HxVector (double *a0*, double *a1*, double *a2*, double *a3*) [inline]

Vector of size 4, with given values.

```
251 {
252     _n = 4;
253     _data = new double[_n];
254     _data[0] = a0;
255     _data[1] = a1;
256     _data[2] = a2;
257     _data[3] = a3;
258 }
```

8.458.2.7 HxVector::HxVector (const HxVector & *v*) [inline]

Copy constructor.

```
261 {
262     _n = v.nElem();
263     _data = new double[_n];
264 
265     double* t = v._data;
266     double* u = _data;
267     int i = v.nElem();
268     while (--i >= 0)
269         *u++ = *t++;
270 }
```

8.458.2.8 HxVector::HxVector (const HxMatrix & *m*)

Copy from matrix constructor.

```
27 {
28     _n = m.nElem();
29     _data = new double[_n];
30 
31     double* t = m._data;
32     double* u = _data;
33     int i = m.nElem();
34     while (--i >= 0)
35         *u++ = *t++;
36 }
```

8.458.3 Member Function Documentation

8.458.3.1 int HxVector::nElem () const [inline]

Number of elements.

```
279 {
280     return _n;
281 }
```

8.458.3.2 int HxVector::valid () const [inline]

Indicates whether the vector is valid.

```
285 {
286     return (_n != 0);
287 }
```

8.458.3.3 HxVector & HxVector::operator= (double *a*) [inline]

Assign constant value.

```
291 {
292     int i = nElem();
293     double *t = _data;
294     while (--i >= 0)
295         *t++ = a;
296     return *this;
297 }
```

8.458.3.4 HxVector & HxVector::operator= (const HxVector & *v*) [inline]

Normal assignment.

```
301 {
302     if (this != &v) {
303         delete [] _data;
304         _n = v.nElem();

306         double *t = _data;
307         double *u = v._data;
308         int i = v.nElem();
309         while (--i >= 0)
310             *t++ = *u++;
311     }
312     return *this;
313 }
```

8.458.3.5 double & HxVector::operator[ ] (int *i*) const [inline]

Subscripting, start with 0.

```
317 {
318     return _data[i];
319 }
```

8.458.3.6 HxVector HxVector::operator- () const [inline]

Unary minus.

```
323 {
324     HxVector m(*this);
325     double* t = m._data;
326     double* u = _data;
327     int i = nElem();
328     while (--i >= 0)
329         *t++ = -(*u++);
330     return m;
331 }
```

8.458.3.7 HxMatrix HxVector::t () const

Transpose Matrix.

```
99 {
100     HxMatrix m(nElem(), 1);
101     int i;
102     for (i=0 ; i<nElem() ; i++)
103             m[0][i] = (*this)[i];
104     return m;
105 }
```

8.458.3.8 HxMatrix HxVector::diag () const

Diagonal Matrix.

```
109 {
110     int n = nElem();
111     HxMatrix m(n, n, 0.0);
112
113     double *t = _data;
114
115     for (int i = 0; i < nElem(); i++)
116         m[i][i] = *t++;
117
118     return m;
119 }
```

8.458.3.9 HxVector HxVector::add (const HxVector & *b*) const

Addition.

Equivalent to : a+b

```
124 {
125     return *this+b;
126 }
```

8.458.3.10 HxVector HxVector::add (const double *val*) const

Addition.

Equivalent to : a+val

```
130 {
131     return *this+val;
132 }
```

8.458.3.11 HxVector HxVector::sub (const HxVector & *b*) const

Subtraction.

Equivalent to : a-b

```
136 {
137     return *this-b;
138 }
```

8.458.3.12 HxVector HxVector::sub (const double *val*) const

Subtraction.

Equivalent to : a-val

```
142 {
143     return *this-val;
144 }
```

8.458.3.13 HxVector HxVector::mul (const HxVector & *b*) const

Multiplication.

Equivalent to : a∗b

```
148 {
149     return *this*b;
150 }
```

8.458.3.14 HxVector HxVector::mul (const HxMatrix & *m*) const

Multiplication.

Equivalent to : a∗v

```
160 {
161     return *this*m;
162 }
```

8.458.3.15 HxVector HxVector::mul (const double *val*) const

Multiplication.

Equivalent to : a∗val

```
154 {
155     return *this*val;
156 }
```

8.458.3.16 HxVector HxVector::div (const double *val*) const

Division.

Equivalent to : a/val

```
166 {
167     return *this/val;
168 }
```

8.458.3.17 HxVector HxVector::sin () const

Apply sin to each element.

```
172 {
173     return map(::sin);
174 }
```

8.458.3.18 HxVector HxVector::cos () const

Apply cos to each element.

```
178 {
179     return map(::cos);
180 }
```

8.458.3.19 HxVector HxVector::tan () const

Apply tan to each element.

```
184 {
185     return map(::tan);
186 }
```

8.458.3.20 HxVector HxVector::sinh () const

Apply sinh to each element.

```
190 {
191     return map(::sinh);
192 }
```

8.458.3.21 HxVector HxVector::cosh () const

Apply cosh to each element.

```
196 {
197     return map(::cosh);
198 }
```

8.458.3.22 HxVector HxVector::tanh () const

Apply tanh to each element.

```
202 {
203     return map(::tanh);
204 }
```

8.458.3.23 HxVector HxVector::exp () const

Apply exp to each element.

```
208 {
209     return map(::exp);
210 }
```

8.458.3.24 HxVector HxVector::log () const

Apply log to each element.

```
214 {
215     return map(::log);
216 }
```

8.458.3.25 HxVector HxVector::sqrt () const

Apply sqrt to each element.

```
220 {
221     return map(::sqrt);
222 }
```

8.458.3.26 HxVector HxVector::abs () const

Apply abs to each element.

```
226 {
227     return map(::fabs);
228 }
```

8.458.3.27 HxVector HxVector::sgn () const

Apply sgn to each element.

```
234 {
235     return map(::sgn);
236 }
```

8.458.3.28 HxVector HxVector::map (double(∗ *f*)(double)) const [inline]

Map f to each element of this.

```
444 {
445     HxVector m(*this);
446     double* t = m._data;
447     double* u = _data;
448     int i = nElem();
449     while (--i >= 0)
450             *t++ = f(*u++);
451     return m;
452 }
```

8.459 HxVectorR2 Class Reference

Class definition for vectors in R2 (real-value coordinates).

`#include <HxVectorR2.h>`

Public Methods

- **HxVectorR2** ()

  Constructor.

- **HxVectorR2** (double d1, double d2)

  Constructor.

- **HxVectorR2** (const **HxPointR2** &p1, const **HxPointR2** &p2)

Constructor : p1-p2.

- double **x** () const
  Get the first element of the vector.
- double **y** () const
  Get the second element of the vector.
- HxVectorR2 **add** (const HxVectorR2 &arg) const
  Add the given vector to this.
- HxVectorR2 **sub** (const HxVectorR2 &arg) const
  Subtract the given vector from this.
- HxVectorR2 **mul** (double arg) const
  Multiply this vector with a scalar.
- HxVectorR2 **div** (double arg) const
  Divide this vector by a scalar.
- double **dot** (const HxVectorR2 &arg) const
  Dot product.
- double **cross2D** (const HxVectorR2 &arg) const
  Cross product (?).
- double **magnitude** () const
  Magnitude.
- double **squaredMagnitude** () const
  Squared magnitude.
- HxVectorR2 **normal** () const
  Normal.
- STD_OSTREAM & **put** (STD_OSTREAM &) const
  Put the arrow on the given stream.
- STD_OSTREAM & **dump** (HxVectorR2 &) const
- **HxString toString** () const

8.459.1 Detailed Description

Class definition for vectors in R2 (real-value coordinates).

8.459.2 Constructor & Destructor Documentation

8.459.2.1 HxVectorR2::HxVectorR2 () [inline]

Constructor.

```
87                          : _data(0,0)
88 {
89 }
```

8.459.2.2 HxVectorR2::HxVectorR2 (double *d1*, double *d2*) [inline]

Constructor.

```
92                                              : _data(d1, d2)
93 {
94 }
```

8.459.2.3 HxVectorR2::HxVectorR2 (const HxPointR2 & *p1*, const HxPointR2 & *p2*)

Constructor : p1-p2.

```
16 {
17     _data = HxVec2Double(p1.x()-p2.x(), p1.y()-p2.y());
18 }
```

8.459.3 Member Function Documentation

8.459.3.1 double HxVectorR2::x () const [inline]

Get the first element of the vector.

```
98 {
99     return _data.x();
100 }
```

8.459.3.2 double HxVectorR2::y () const [inline]

Get the second element of the vector.

```
104 {
105     return _data.y();
106 }
```

8.459.3.3 HxVectorR2 HxVectorR2::add (const HxVectorR2 & *arg*) const [inline]

Add the given vector to this.

```
110 {
111     return HxVectorR2( _data.x()+arg.x(), _data.y()+arg.y());
112 }
```

8.459.3.4 HxVectorR2 HxVectorR2::sub (const HxVectorR2 & *arg*) const [inline]

Subtract the given vector from this.

```
116 {
117     return HxVectorR2( _data.x()-arg.x(), _data.y()-arg.y());
118 }
```

8.459.3.5 HxVectorR2 HxVectorR2::mul (double *arg*) const [inline]

Multiply this vector with a scalar.

```
122 {
123     return HxVectorR2( _data.x()*arg, _data.y()*arg);
124 }
```

8.459.3.6 HxVectorR2 HxVectorR2::div (double *arg*) const [inline]

Divide this vector by a scalar.

```
128 {
129     return HxVectorR2( _data.x()/arg, _data.y()/arg);
130 }
```

8.459.3.7 double HxVectorR2::dot (const HxVectorR2 & *arg*) const [inline]

Dot product.

```
134 {
135     return _data.dot(arg._data).x();
136 }
```

8.459.3.8 double HxVectorR2::cross2D (const HxVectorR2 & *arg*) const [inline]

Cross product (?).

```
140 {
141     return _data.x()*arg.y() + _data.y()*arg.x();
142 }
```

8.459.3.9 double HxVectorR2::magnitude () const [inline]

Magnitude.

```
146 {
147     return _data.norm2().x();
148 }
```

8.459.3.10 double HxVectorR2::squaredMagnitude () const [inline]

Squared magnitude.

```
152 {
153     return _data.x()*_data.x() + _data.y()*_data.y();
154 }
```

8.459.3.11 HxVectorR2 HxVectorR2::normal () const [inline]

Normal.

```
158 {
159     return HxVectorR2(_data.y(), -_data.x());
160 }
```

8.459.3.12 STD_OSTREAM & HxVectorR2::put (STD_OSTREAM & *os*) const [inline]

Put the arrow on the given stream.

```
170 {
171     return os << _data;
172 }
```

- **HxString className** ()

8.460.1 Detailed Description

template<class ArithT, class ImgT, class MaskT> class QThinning< ArithT, ImgT, MaskT >

This should be implemented (Rein) as repetitive substraction from the image of result of HitOrMiss.

As they are not rotation invariant, the structuring elements of have to be rotated

This is defined only for binary images 1 - pixels = object 0 - pixels = background

The documentation for this class was generated from the following file:

- HxThinning.c

8.461 RGB2Intensity Class Template Reference

Pixel functor for computation of RGB2Intensity.

Public Types

- typedef **HxTagTransInVar TransVarianceCategory**
  Functor is translation invariant.

Public Methods

- **RGB2Intensity** (**HxTagList** &)
  Constructor : get parameters from taglist.
- DstValT **doIt** (const SrcValT &x)
  Actual operation.

Static Public Methods

- **HxString className** ()

  The name : "RGB2Intensity".

8.461.1 Detailed Description

template<class DstValT, class SrcValT> class RGB2Intensity< DstValT, SrcValT >

Pixel functor for computation of RGB2Intensity.

8.461.2 Member Typedef Documentation

8.461.2.1 template<class DstValT, class SrcValT> typedef HxTagTransInVar RGB2Intensity::TransVarianceCategory

Functor is translation invariant.

8.461.3 Constructor & Destructor Documentation

8.461.3.1 template<class DstValT, class SrcValT> RGB2Intensity< DstValT, SrcValT >::RGB2Intensity (HxTagList & *tl*)

Constructor : get parameters from taglist.

```
38 {
39 }
```

8.461.4 Member Function Documentation

8.461.4.1 template<class DstValT, class SrcValT> DstValT RGB2Intensity< DstValT, SrcValT >::doIt (const SrcValT & *x*) [inline]

Actual operation.

```
44 {
45     return 0.212671*x.x() + 0.715160*x.y() + 0.072169*x.z();
46 }
```

8.461.4.2 template<class DstValT, class SrcValT> HxString RGB2Intensity< DstValT, SrcValT >::className () [static]

The name : "RGB2Intensity".

```
51 {
52     return HxString("RGB2Intensity");
53 }
```

The documentation for this class was generated from the following file:
